# 1 Package ethanol

This package contains some components to implement Ethanol API.  
ethanol should run as a pox module

sample command call:

```
python ./pox.py forwarding.l2_learning ethanol.server
```

ethanol.server is the ~/ethanol/python/server.py file

you must create a symbolic link inside pox subtree, like:

```
cd ~/ethanol/pox/pox
```

```
ln ~/ethanol/python ethanol
```

## 1.1 Modules

- **client\_test**: For TESTING purpose only.  
(Section 2, p. 6)
- **ethanol**: This package contains the main classes to implement Ethanol API.  
(Section 3, p. 7)
  - **ap**: Defines the AP class.  
(Section 4, p. 8)
  - **device**: This module provides: class device.Device  
(Section 5, p. 13)
  - **network**: defines the Network class that represents the SSIDs controlled by the Ethanol Controller  
(Section 6, p. 18)
  - **radio**: This module provides: class radio.Radio  
(Section 7, p. 21)
  - **station** (Section 8, p. 25)
  - **switch**: An L2 learning switch based on L2 learning example from POX  
(Section 9, p. 28)
  - **vap**: This module provides: class VAP  
(Section 10, p. 30)
- **events** (Section 11, p. 36)
  - **events**: Events ~~~~~  
(Section 12, p. 38)
  - **tests** (Section 13, p. 41)
    - \* **tests** (Section 14, p. 42)
- **graph\_coloring**: This package contains some extra components.  
(Section 15, p. 48)
  - **exact\_color**: Graph coloring  
(Section 16, p. 49)
- **ovsdb**: This package contains a python ovsdb client  
(Section 17, p. 50)
  - **ovsdb**: OVSDb calls.  
(Section 18, p. 51)
- **server**: This is a pox module.  
(Section 19, p. 53)
- **ssl\_message**: This package contains some components to implement Ethanol API.

(Section 20, p. 55)

- **enum** (Section 21, p. 58)
- **msg\_acs**: implements the following messages:  
(Section 22, p. 59)
- **msg\_ap\_broadcastssid**: implements the following messages:  
(Section 23, p. 61)
- **msg\_ap\_ctsprotection\_enabled**: implements the following messages:  
(Section 24, p. 63)
- **msg\_ap\_dtiminterval**: implements the following messages:  
(Section 25, p. 65)
- **msg\_ap\_frameburstenabled**: implements the following messages:  
(Section 26, p. 67)
- **msg\_ap\_guardinterval**: implements the following messages:  
(Section 27, p. 69)
- **msg\_ap\_in\_range**: implements the following messages:  
(Section 28, p. 71)
- **msg\_ap\_interferencemap**: implements the following messages:  
(Section 29, p. 73)
- **msg\_ap\_modes**: implements the following messages:  
(Section 30, p. 74)
- **msg\_ap\_rtsthreshold**: implements the following messages:  
(Section 31, p. 75)
- **msg\_ap\_ssid**: implements: \* get\_ap\_ssids  
(Section 32, p. 77)
- **msg\_association**: implements:  
(Section 33, p. 79)
- **msg\_beacon\_interval**: handles the beacon interval information: gets or sets it.  
(Section 34, p. 81)
- **msg\_bitrates**: implements the following messages:  
(Section 35, p. 83)
- **msg\_bye**: implements the BYE message  
(Section 36, p. 86)
- **msg\_changed\_ap**: implements the following messages:  
(Section 37, p. 88)
- **msg\_channelinfo**: implements the following messages:  
(Section 38, p. 90)
- **msg\_channels**: implements the following messages:  
(Section 39, p. 92)
- **msg\_common**: this module contains important constants use through out our implementation  
(Section 40, p. 95)
- **msg\_core**: All ssl\_modules use python construct (<https://pypi.python.org/pypi/construct>).  
(Section 41, p. 98)
- **msg\_enabled**: implements the following messages:  
(Section 42, p. 100)
- **msg\_error**: error messages  
(Section 43, p. 102)
- **msg\_frequency**: implements the following messages:  
(Section 44, p. 103)
- **msg\_handle\_snr**: implements:  
(Section 45, p. 105)
- **msg\_hello**: basic hello message.

- (Section 46, p. 108)
- **msg\_hostapd\_conf**: configure hostapd.  
(Section 47, p. 110)
- **msg\_interfaces**: implements the following messages:  
(Section 48, p. 112)
- **msg\_log**: defines if our modules will use pox.log facility or python log facility  
(Section 49, p. 114)
- **msg\_mean\_sta\_stats**: implements the following messages:  
(Section 50, p. 115)
- **msg\_memcpu**: implements the following messages:  
(Section 51, p. 119)
- **msg\_metric**: implements:  
(Section 52, p. 121)
- **msg\_mlme**: implements the following MLME messages:  
(Section 53, p. 123)
- **msg\_mtu\_qlen**: implements: \* set\_txqueuelen \* set\_mtu  
(Section 54, p. 126)
- **msg\_ping**: implements:  
(Section 55, p. 128)
- **msg\_powersave**: implements the following messages:  
(Section 56, p. 130)
- **msg\_preamble**: implements: \* get\_preamble \* set\_preamble  
(Section 57, p. 132)
- **msg\_radio\_wlans**: implements the following messages:  
(Section 58, p. 134)
- **msg\_sent\_received**: implements the following messages:  
(Section 59, p. 136)
- **msg\_server**: this is creates the server, that deals with clients (aps and stations) messages the messages implemented are mapped in map\_msg\_to\_procedure main entry to this module is: call run(server)  
(Section 60, p. 141)
- **msg\_snr\_power**: implements the following messages:  
(Section 61, p. 143)
- **msg\_ssid**: implements the following messages:  
(Section 62, p. 146)
- **msg\_sta\_link\_information**: implements the following messages:  
(Section 63, p. 148)
- **msg\_sta\_statistics**: implements the following messages:  
(Section 64, p. 150)
- **msg\_station\_trigger\_transition**: implements the following messages:  
(Section 65, p. 152)
- **msg\_statistics**: implements the following messages:  
(Section 66, p. 153)
- **msg\_tos**: implements the following messages:  
(Section 67, p. 155)
- **msg\_uptime**: implements the following messages:  
(Section 68, p. 157)
- **msg\_wlan\_info**: implements: \* req\_wlan\_info(): MSG\_WLAN\_INFO  
(Section 69, p. 158)

## 1.2 Variables

Name	Description
__package__	<b>Value:</b> None

## 2 Module `ethanol.client_test`

For TESTING purpose only. Don't use it as a template to your code. This module uses construct (<https://pypi.python.org/pypi/construct>) See more info at `msg_core.py` on how to install it.

We use this module to test ethanol messages. It does not use Ethanol architecture, only its messages. We must import the correct message module, and place its call in `launch()`

This is a pox module. It should be called using `pox.py`.

Command sample:

```
cd pox ./pox.py ethanol.client_test -server_address='thunder' -server_port=22223
```

### 2.1 Functions

<b>msg_acs</b> ( <i>connect</i> , <i>intf_name</i> ='wlan0', <i>num_acs_tests</i> =1)
---

this is a test function. it runs <code>num_acs_tests</code> times on interface <code>wlan0</code>
---

<b>launch</b> ( <i>server_address</i> ='0.0.0.0', <i>server_port</i> ='22223', <i>num_acs_tests</i> =1, <i>intf_name</i> ='wlan0', <i>mac_sta</i> ='0c:84:dc:d4:7a:73')
--

<code>launch</code> is a default method used by pox to load and run this module
---

### 3 Package ethanol.ethanol

This package contains the main classes to implement Ethanol API.

**See Also:** file Entidades-vxxxx.pdf contains the class diagram for this API

#### Change Log:

- Entidades-v1.pdf
- Entidades-v2.pdf
- Entidades-v3.pdf

#### 3.1 Modules

- **ap:** Defines the AP class.  
(Section 4, p. 8)
- **device:** This module provides: class device.Device  
(Section 5, p. 13)
- **network:** defines the Network class that represents the SSIDs controlled by the Ethanol Controller  
(Section 6, p. 18)
- **radio:** This module provides: class radio.Radio  
(Section 7, p. 21)
- **station** (Section 8, p. 25)
- **switch:** An L2 learning switch based on L2 learning example from POX  
(Section 9, p. 28)
- **vap:** This module provides: class VAP  
(Section 10, p. 30)

#### 3.2 Variables

Name	Description
__package__	<b>Value:</b> None

## 4 Module *ethanol.ethanol.ap*

Defines the AP class. It represents the physical access point.

**Author:** Henrique Duarte Moura

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 4.1 Functions

<b>connected_aps()</b>
use this function to get the dictionary that contains all aps currently connected to Ethanol controller
<b>Return Value</b> list of ap's objects

<b>is_ap_with_ip_connected(<i>ip</i>)</b>
<b>Return Value</b> TRUE if an AP with the ip provided as a parameter is connected
<b>Note:</b> this is the ip of the AP's interface that sends packets to the controller, i.e., normally it is an ethernet interface

<b>get_ap_by_ip(<i>ip</i>)</b>
get the AP object with an IP address (of the connection to the controller)
<b>Parameters</b> ip: a string with the ip address in dotted format
<b>Return Value</b> the AP object that has the provided ip address, or None if it doesn't exist

<b>get_vap_by_mac_address(<i>mac_address</i>)</b>
get a VAP object by its MAC address (BSSID)
<b>Parameters</b> mac_address: MAC address in dotted format of the Virtual AP (SSID)
<b>Return Value</b> a VAP object that matches the mac_address or None if doesn't match

**add\_ap\_openflow(*ip*)**

called at ethanol.server when connectionUp occurs. inserts an entry in map\_openflow\_vs\_ethanol\_ip with the ip detected in pox.openflow.connection. when a Hello message arrives, AP.\_\_init\_\_() searches this mapping and assigns self to this entry

**Parameters**

**ip:** a string with the ip address in dotted format  
(*type=*str)

**add\_ap(*client\_address*)**

Create (and return) an AP object for the the device represented by the tuple client\_address. This function updates a list of these objects.

used by the Hello message's process

**Parameters**

**client\_address:** tuple with (ip, port) used to make a socket connection to the AP  
(*type=tuple or list*)

**remove\_ap\_byIP(*ip*)**

removes the ap from the list called by AP.\_\_destroy\_\_() or when the server receives a "bye message" from such AP

**Parameters**

**ip:** a string with the ip address in dotted format  
(*type=*str)

## 4.2 Variables

Name	Description
map_openflow_vs_ethanol_ip	provides a mapping from the ap's ip address to the ap object <b>Value:</b> {}

## 4.3 Class AP

object  ethanol.ethanol.ap.AP

defines the AP class that represents the physical wifi device

## 4.3.1 Methods

<b><code>__init__(self, ip, port=SERVER_PORT)</code></b> <hr/> constructor <b>Parameters</b> <b>ip:</b> socket IP address to connect to the physical AP <b>port:</b> socket port to connect to the physical AP Overrides: object. <code>__init__</code>
<b><code>id(self)</code></b> <hr/> AP's unique identifier <b>Return Value</b> AP's <code>uuid.uuid4()</code> value
<b><code>__del__(self)</code></b> <hr/> Called when the instance is about to be destroyed. Removes this ap from the mapping
<b><code>__str__(self)</code></b> <hr/> string <b>Return Value</b> the ip and port of this device Overrides: object. <code>__str__</code>
<b><code>radios(self)</code></b> <hr/> get list of AP's radios <b>Return Value</b> a list of radio objects associated with the AP
<b><code>msg_id(self)</code></b> <hr/> helper function: returns the next message id to be sent, and increments the message ID by 1 <b>Return Value</b> id for the new message
<b><code>vaps(self)</code></b> <hr/> returns a list of the vaps configured in this AP <b>Return Value</b> list of VAP objects

---

**createvirtualap\_and\_insert\_listvap**(*self, ssid, radio, mac\_address*)

---

create the VAP based on ssid, radio, and mac\_address inserts the vap in self.\_\_listVAP list

**Parameters**

**ssid:** BSSID  
*(type=str)*

**radio:** object RADIO attached to this AP

**mac\_address:** MAC address in dotted format  
*(type=str)*

**Return Value**

the vap created

---

---

**destroyvirtualap**(*self, vap*)

---

remove a VAP: deactivate it (remove SSID)

**Parameters**

**vap:** a vap object (SSID connected to this AP)  
*(type=vap.VAP object)*

---

---

**getsupportedinterfacemodes**(*self, intf\_name*)

---

indicates the modes supported

**Return Value**

a list with the supported modes: AP, Station, Mesh, IBSS

---

---

**getinterferencemap**(*self, intf\_name*)

---

NOT IMPLEMENTED YET returns the interference map as defined in 802.11/2012

---

---

**listwlan\_interfaces**(*self*)

---

wireless interfaces in this AP

**Return Value**

a list with the names of wireless interfaces in this AP

---

---

**get\_interface\_stats**(*self*)

---

get statistics for all interfaces

---

---

**enable\_interface\_stats**(*self*)

---

---

**disable\_interface\_stats**(*self*)

---

---

**statistics\_time**(*self, new\_time*)

---

**Parameters**

**new\_time:** set the time of collection in miliseconds. send -1 to disable data collection

---

<b>statistics_alpha</b> ( <i>self</i> , <i>alpha</i> )
--

defines alpha value for EWMA
------------------------------

<b>read_hostapd_conf_param</b> ( <i>self</i> , <i>param</i> )
---

reads the hostapd.conf, finds the param requested, and returns its value
--

<b>write_hostapd_conf_param</b> ( <i>self</i> , <i>param</i> , <i>value</i> )
---

reads the hostapd.conf, finds the param requested, and (over)write value to its contents
--

### *Inherited from object*

\_\_delattr\_\_(), \_\_format\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(),  
 \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_repr\_\_(), \_\_setattr\_\_(), \_\_sizeof\_\_(),  
 \_\_subclasshook\_\_()

#### 4.3.2 Properties

## 5 Module ethanol.ethanol.device

This module provides: class device.Device

It is a superclass for Station and VAP

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 5.1 Variables

Name	Description
METRIC_TO_SUBSCRIBE	<b>Value:</b> ['bytesReceived', 'bytesSent', 'bytesLost', 'packetsRecei...]

### 5.2 Class Device

this superclass provides the attributes and methods shared by Station and VAP

#### 5.2.1 Methods

<b>__init__</b> ( <i>self, socket, intf_name</i> )
creates a device object (used by VAP and STATION)
<b>Parameters</b>
<b>socket:</b> tuple (ip, port_num)
<b>intf_name:</b> name of the wireless interface that this device uses
Overrides: object.__init__

<b>id</b> ( <i>self</i> )
unique identifier (UUID) for this device
<b>get_connection</b> ( <i>self</i> )
returns a tuple representing the socket to connection to the physical station
<b>msg_id</b> ( <i>self</i> )
helper function: returns the next message id to be sent. increments the message ID by 1
<b>intf_name</b> ( <i>self</i> )
wireless interface of this device (set during <code>__init__</code> )
<b>mac_address</b> ( <i>self</i> )
wireless interface's MAC address
<b>ipv4_address</b> ( <i>self</i> , <i>ip_conf</i> )
NOT IMPLEMENTED YET – function in C is ok  set IP v4 parameters: ip, netmask, gateway
<b>ipv6_address</b> ( <i>self</i> , <i>ip_conf</i> )
NOT IMPLEMENTED YET – function in C is ok  set the device's IP address (version 6)
<b>fastBSSTransition_compatible</b> ( <i>self</i> )
connect to ap requesting if it is "Fast BSS Transition" compatible
<b>bytesReceived</b> ( <i>self</i> )
number of bytes received on this interface (cumulative value)
<b>bytesSent</b> ( <i>self</i> )
number of bytes sent on this interface (cumulative value)
<b>bytesLost</b> ( <i>self</i> )
number of bytes lost on this interface (cumulative value)

<b>packetsReceived</b> ( <i>self</i> )
number of packets received on this interface (cumulative value)
<b>packetsSent</b> ( <i>self</i> )
number of packets sent on this interface (cumulative value)
<b>packetsLost</b> ( <i>self</i> )
number of packets lost on this interface (cumulative value)
<b>jitter</b> ( <i>self</i> )
NOT IMPLEMENTED YET
<b>Return Value</b> mean jitter measured at the wireless interface
<b>delay</b> ( <i>self</i> )
NOT IMPLEMENTED YET
<b>Return Value</b> mean delay measured at the wireless interface
<b>retries</b> ( <i>self</i> )
NOT IMPLEMENTED YET
<b>Return Value</b> number of retries at the wireless interface
<b>failed</b> ( <i>self</i> )
NOT IMPLEMENTED YET
<b>Return Value</b> total number of failures at the wireless interface
<b>statistics</b> ( <i>self</i> )
collect some cumulative statistics – rx_packets, rx_bytes, rx_dropped, tx_packets, tx_bytes. these values are accumulate since the interface went up.
<b>signalStrength</b> ( <i>self</i> )
NOT IMPLEMENTED YET

the interface bar

<b>getAPsInRange(<i>self</i>)</b>
-----------------------------------

get aps that are in range.
----------------------------

<b>Note:</b> this method is not precise, because it relies on the spare time the device has to scan all the channels
--

<b>clear__mange(<i>self</i>)</b>
----------------------------------

<b>add__tos(<i>self</i>, <i>rules</i>)</b>
--

<b>replace__tos(<i>self</i>, <i>rules</i>)</b>
--

<b>subscribe__metric(<i>self</i>, <i>metrics</i>, <i>period</i>=100, <i>activate</i>=True)</b>
--

check if all metrics are valid ones
-------------------------------------

<b>evMetric(<i>self</i>, <i>metric</i>, <i>value</i>)</b>
---

this method should be overwritten to deal with received metrics
---

### *Inherited from object*

\_\_delattr\_\_(), \_\_format\_\_(), \_\_getattr\_\_(), \_\_hash\_\_(), \_\_new\_\_(),  
 \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_repr\_\_(), \_\_setattr\_\_(), \_\_sizeof\_\_(),  
 \_\_str\_\_(), \_\_subclasshook\_\_()

### 5.2.2 Properties

Name	Description
<i>Inherited from object</i>	
__class__	

## 6 Module `ethanol.ethanol.network`

defines the Network class that represents the SSIDs controlled by the Ethanol Controller

This module provides:

- 1) `add_network(net)`
- 2) `del_network(net)`
- 3) `get_or_create_network_by_ssid(ssid)`
- 4) class `Network`

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 6.1 Functions

<b><code>list_of_networks()</code></b>
--

<b><code>add_network(ssid, net)</code></b>
--

returns True if successfully added the network to the set. False if the SSID of the network provided already exists. net is also not added to the set @return boolean
---

<b><code>del_network(net)</code></b>
--------------------------------------

delete this network: disconfigures all vaps associated to this network @param net the network to be deleted
---

<b><code>get_or_create_network_by_ssid(ssid)</code></b>
---

@return a Network object representing the ssid. if none exists, a new one is created
--

## 6.2 Class Network

object —  
**ethanol.ethanol.network.Network**

handle a network - a network is a set of VAPs that share the same SSID

### 6.2.1 Methods

<b>__init__</b> ( <i>self</i> , <i>ssid</i> )
create a network with ESSID = ssid Overrides: object.__init__
<b>__del__</b> ( <i>self</i> )
class destructor Called when the instance is about to be destroyed.
<b>releaseResources</b> ( <i>self</i> )
deconfigure vap's SSID
<b>id</b> ( <i>self</i> )
returns the network's internal class ID
<b>vaps</b> ( <i>self</i> )
returns VAPs associated to this network
<b>SSID</b> ( <i>self</i> , <i>newSSID</i> , <i>keepenabled=False</i> )
change the SSID of the network
<b>associateVirtualAP</b> ( <i>self</i> , <i>vap</i> )
join the vap to the network. called by ssid.setter in VAP class
<b>deassociateVirtualAP</b> ( <i>self</i> , <i>vap</i> )
releases the vap from the network called by ssid.setter in VAP class

**handoffUser**(*station*, *new\_vap*)

handles handoff. This method relies on 802.11 mobility domain feature. So the station and the AP should be configure to use mobility domain. This method disassociates the station from a vap in the network and moves it to a *new\_vap* in this network. It also sends a message to the station, using `station.triggerTransition()`, instructing it to roam to a new ap.

**See Also:** documentacao-para-handover.pdf for instruction on how to set up the station and the AP for handover. \*\*\*\* not implemented yet \*\*\*\*

### *Inherited from object*

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`,  
`__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`,  
`__str__()`, `__subclasshook__()`

### 6.2.2 Properties

Name	Description
<i>Inherited from object</i>	
<code>__class__</code>	

## 7 Module **ethanol.ethanol.radio**

This module provides: class `radio.Radio`

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 7.1 Class **Radio**

object —  
**ethanol.ethanol.radio.Radio**

Radio represents the physical radios attached to an AP

abstracts the physical radio

#### 7.1.1 Methods

<b>__init__</b> ( <i>self</i> , <i>ap</i> , <i>wiphy_name</i> , <i>ip</i> , <i>port</i> ) <hr/> creates an object associated with the "ap" must provide the wiphy_name (intf_name) Overrides: object.__init__
<b>id</b> ( <i>self</i> ) <hr/> Radio UUID
<b>__str__</b> ( <i>self</i> ) <hr/> returns the ip and port of this device Overrides: object.__str__

**msg\_id**(*self*)

handles the radio message id's

**Return Value**

an id to be used in the message and increments the current id

**wiphy**(*self*)**Return Value**

the wireless interface name

**validChannels**(*self*)

informs a list of valid channel numbers, supported by the device in its wireless interface

**Return Value**the list of the channels that can be assigned to this interface.  
Returns [] if an error occurs**currentChannel**(*self*, *new\_channel*)

tries to set the ap channel.

**Note:** to confirm that the channel was changed, issue currentChannel()**frequency**(*self*, *new\_frequency*)

not implemented yet

same as currentChannel() but uses the frequency instead

**tx\_bitrates**(*self*, *tx\_bitrates*)

not implemented yet

**powerSaveMode**(*self*, *new\_mode*)

sets the power mode of the ap to (on or off)

**fragmentationThreshold**(*self*, *new\_threshold*)

not implemented yet

**channelBandwidth**(*self*, *new\_chbw*)

not implemented yet

**channelInfo(*self*)**

uses MSG\_GET\_CHANNELINFO to get information for each channel available for the wireless interface

**Return Value**

a list with channel info – active\_time, busy\_time, channel\_type, extension\_channel\_busy\_time, frequency, in\_use, noise, receive\_time, transmit\_time

**wireless\_interfaces(*self*)**

get a list of all wireless interfaces

**Return Value**

list of interfaces

**fastBSSTransition(*self*)**

connect to ap requesting if it is "Fast BSS Transition" compatible

**beaconInterval(*self*, *value*=100)**

connect to AP to set beacon interval value returns nothing

**getWirelessInterfaceInfo(*self*)**

call ap to get information about this interface

**getLinkStatitics(*self*)**

not implemented yet

**getACS(*self*, *num\_tests*=1)**

request that the AP computes the ACS factor for each frequency in the intf\_name interface

**define\_msg\_to\_capture(*self*, *rules*, *func*)**

this register in the AP rules to send all matched wireless messages to the Ethanol controller

**Parameters**

**func:** handler function for this messages the function has one parameter: func(received\_frame)

**rules:** a list of rules - each rule identifies a type of wireless frame that should be sent to the controller

<b>send_frame</b> ( <i>self</i> , <i>packet</i> )
---

calls the AP so it sends the frame
------------------------------------

<b>Parameters</b>
-------------------

<b>packet</b> : fully formatted (binary) packet to be sent by the AP
--

***Inherited from object***

```

__delattr__(), __format__(), __getattr__(), __hash__(), __new__(),
__reduce__(), __reduce_ex__(), __repr__(), __setattr__(), __sizeof__(),
__subclasshook__()

```

**7.1.2 Properties**

## 8 Module *ethanol.ethanol.station*

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 8.1 Functions

**add\_station**(*client\_address*)

Create (and return) possibly several objects, one for each wireless connections identified by (client\_address, interface name). This function updates a list of these objects.

client\_address = (ip, port) used by the Hello message's process

**get\_station\_by\_mac\_address**(*mac\_address*)

returns a connected station (object), provided its mac address

**get\_station\_by\_ip**(*ip*)

returns a dictionary containing the connected station, provided its ip address  
note: that the object are indexed by the intf\_name, in case the station has multiple wireless interfaces e.g. list\_of\_stations[ip]['wlan0']

**is\_sta\_with\_ip\_connected**(*ip*)

**Return Value**

TRUE if an STA with the ip provided as a parameter is connected

**Note:** this is the ip of the STA's interface that sends packets to the controller, i.e., normally it is an ethernet interface

### 8.2 Variables

Name	Description
list_of_stations	<b>Value:</b> {}

### 8.3 Class Station

This module contains the Station class. Its objects represent each user connected to the VAP Each station is identified by its ip address and wireless interface name

#### 8.3.1 Methods

<b><code>__init__(self, socket, intf_name='wlan0')</code></b>
constructor: creates an object that represents the user connection receives an ip/port pair from the hello message uses this info to connect to the station and retrieve the radio it is connected to
<b><code>__del__(self)</code></b>
destructor
<b><code>vap(self)</code></b>
the VAP the station is connected to
<b><code>radio(self)</code></b>
this station is connected to radio, if radio is None the AP is not ethanol enabled
<b><code>wireless_interfaces(self)</code></b>
returns all wireless enabled interfaces of the device
<b><code>getInterferenceMap(self)</code></b>
not implemented yet
<b><code>getChannelInfo(self)</code></b>
not implemented yet
<b><code>getBeaconInfo(self)</code></b>
not implemented yet

**getNoiseInfo**(*self*)

not implemented yet

**getLinkMeasurement**(*self*)

not implemented yet

**getStatistics**(*self*)

not implemented yet

**getLocation**(*self*)

not implemented yet

**triggerTransition**(*self*, *new\_vap*)

uses message MSG\_TRIGGER\_TRANSITION to send to the station a command to change to a new ap

**Parameters**

**new\_ap:** MAC address of the new AP

**\_\_str\_\_**(*self*)

string representation of this station

## 9 Module *ethanol.ethanol.switch*

An L2 learning switch based on L2 learning example from POX

### 9.1 Functions

<b>launch</b> ( <i>transparent=False, hold_down=_flood_delay</i> )
--

Starts an L2 learning switch.
-------------------------------

### 9.2 Variables

Name	Description
log	<b>Value:</b> <code>core.getLogger()</code>

### 9.3 Class *LearningSwitch*

object └─ ***ethanol.ethanol.switch.LearningSwitch***

#### 9.3.1 Methods

<b>__init__</b> ( <i>self, connection, transparent, idle_timeout=10, hard_timeout=30</i> )
--

x.**\_\_init\_\_**(...) initializes x; see `help(type(x))` for signature

Overrides: object.**\_\_init\_\_** extit(inherited documentation)

#### *Inherited from object*

`__delattr__()`, `__format__()`, `__getattr__()`, `__hash__()`, `__new__()`,  
`__reduce__()`, `__reduce_ex__()`, `__repr__()`, `__setattr__()`, `__sizeof__()`,  
`__str__()`, `__subclasshook__()`

#### 9.3.2 Properties

Name	Description

## 10 Module `ethanol.ethanol.vap`

This module provides: class VAP

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 10.1 Class VAP

`pox.ethanol.ethanol.device.Device` —  
`ethanol.ethanol.vap.VAP`

represents the logical AP (defined by the SSID it contains) inherits DEVICE class

#### 10.1.1 Methods

<code>__init__(self, server, ssid, radio, mac_address)</code>
---

constructor:
--------------

<code>__del__(self)</code>
----------------------------

destructor: not implemented yet
---------------------------------

<code>__str__(self)</code>
----------------------------

vap string representation
---------------------------

<code>register_station(self, station=None)</code>
---

register a station in the list called by station. <code>__init__</code>
---

<code>unregister_station(self, station)</code>
--

register a station in the list called by station. <code>__del__</code>
--

**stations**(*self*)

return the stations (objects) currently connected to the VAP and to the controller (ethanol enabled stations)

**radio**(*self*)

the radio to which the radio is connected

**enabled**(*self*, *value*)**ssid**(*self*, *value*)

change the vap's SSID

**broadcastSSID**(*self*, *value*)

not implemented yet

**fastBSSTransitionEnabled**(*self*)

not implemented yet

**security**(*self*)

not implemented yet

**contention**(*self*)

not implemented yet

**cac**(*self*)

not implemented yet

**frameBurstEnabled**(*self*)

:return if AP has frame burst feature enabled

**guardInterval**(*self*)

:return Guard Interval

**dtimInterval**(*self*)

:return DTIM interval

<b>ctsProtection_enabled</b> ( <i>self</i> )
not implemented yet
<b>rtsThreshold</b> ( <i>self</i> )
get RTS threshold, if 0 RTS/CTS is not used
<b>getStationInRange</b> ( <i>self</i> )
not implemented yet
<b>evUserConnecting</b> ( <i>self</i> , <i>mac_station</i> )
<b>evUserAssociating</b> ( <i>self</i> , <i>mac_station</i> )
<b>evUserAuthenticating</b> ( <i>self</i> , <i>mac_station</i> )
<b>evUserDisassociating</b> ( <i>self</i> , <i>mac_station</i> )

```

:param *msg* message received

---

**registerMgmtFrame**(*self*, *msg\_type*, *listener*)

---

---

**unregisterMgmtFrame**(*self*, *msg\_type*)

---

not implemented yet inform the AP that it does not need to send information back to the controller about this type of message

---

**connectNewUser**(*self*, *station*, *old\_ap*)

---

not implemented yet transfer information about a station from *old\_ap* to this ap

---

**connected\_stations**(*self*)

---

:return: list of stations MAC address

---

**mlme\_qos\_map\_request**(*self*, *mac\_station*, *mappings*)

---

This primitive is used by an AP to transmit an unsolicited QoS Map Configure frame to a specified STA MAC entity.

**mlme\_scan\_request**(*self*, *mac\_station*, *configs*)

Requests a survey of potential BSSs that the STA can later elect to try to join.  
blocking: waits for response or timeout

**mlme\_channel\_switch**(*self*, *mac\_station*, *configs*)

requests a switch to a new operating channel. blocking: waits for response or timeout

**mlme\_neighbor\_report**(*self*, *mac\_station*)

requests a Neighbor Report. blocking: waits for response or timeout

**mlme\_link\_measurement**(*self*, *mac\_station*, *configs*)

measurement of link path loss and the estimation of link margin between peer entities. blocking: waits for response or timeout

**mlme\_bss\_transition**(*self*, *mac\_station*, *new\_ap*)

measurement of link path loss and the estimation of link margin between peer entities. non-blocking

**get\_queue\_params**(*self*)

get the wifi Queue parameters. They are \_\_used by the access point\_\_ when transmitting frames to the clients.

TODO: create message

**set\_queue\_params**(*self*, *num\_queue*, *aifs*, *cw\_min*, *cw\_max*, *burst\_time*)

set the parameters of one of the wifi Queues (used by the AP)

#### Parameters

- num\_queue:** number of the queue (1 to 4)
  - aifs:** AIFS (default 2)
  - cw\_min:** minimum cw (1, 3, 7, 15, 31, 63, 127, 255, 511, 1023, 2047, 4095, 8191, 16383, 32767)
  - cw\_max:** same values as cwMin, cwMax >= cwMin
  - burst\_time:** maximum length (in milliseconds with precision of up to 0.1 ms) for bursting
- TODO: create message

**get\_wmm\_params(*self*)**

get the wifi Queue parameters (used by the station). These values are sent to WMM clients when they associate. The parameters will be used by WMM clients for frames transmitted to the AP.

**Return Value**

a list with the parameters (4 queues)

TODO: create message

**set\_wmm\_params(*self*, *num\_queue*, *aifs*, *cw\_min*, *cw\_max*, *txop*)**

set the parameters of one of the wifi Queues (used by the station - sent by the AP)

**Parameters**

**num\_queue:** number of the queue (1 to 4)

**aifs:** AIFS (default 2)

**cw\_min:** minimum cw (0, .., 15). The actual cw value used will be  $(2^n)-1$  where n is the value given here.

**cw\_max:** same values as cwMin, cwMax  $\geq$  cwMin

**txop:** is in units of 32 microseconds

TODO: create message

## 11 Package *ethanol.events*

Version: 0.3

### 11.1 Modules

- **events**: Events ~~~~~  
(Section 12, p. 38)
- **tests** (Section 13, p. 41)
  - **tests** (Section 14, p. 42)

### 11.2 Class Events

Encapsulates the core to event subscription and event firing, and feels like a "natural" part of the language.

The class `Events` is there mainly for 3 reasons:

- Events (Slots) are added automatically, so there is no need to declare/create them separately. This is great for prototyping. (Note that `'__events__'` is optional and should primarily help detect misspelled event names.)
- To provide (and encapsulate) some level of introspection.
- To "steel the name" and hereby remove unneeded redundancy in a call like:

```
xxx.OnChange = event('OnChange')
```

#### 11.2.1 Methods

```
__init__(self, events=None)
```

```
__getattr__(self, name)
```

```
__repr__(self)
```

```
__str__(self)
```

```
__len__(self)
```

<code>__iter__(self)</code>
-----------------------------

### 11.3 Class `EventsException`

#### 11.3.1 Methods

##### *Inherited from `exceptions.Exception`*

`__init__()`, `__new__()`

##### *Inherited from `exceptions.BaseException`*

`__delattr__()`, `__getattribute__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`, `__setattr__()`, `__setstate__()`, `__str__()`, `__unicode__()`

##### *Inherited from `object`*

`__format__()`, `__hash__()`, `__reduce_ex__()`, `__sizeof__()`, `__subclasshook__()`

#### 11.3.2 Properties

Name	Description
<i>Inherited from <code>exceptions.BaseException</code></i>	
<code>args</code> , <code>message</code>	
<i>Inherited from <code>object</code></i>	
<code>__class__</code>	

## 12 Module `ethanol.events.events`

`Events`

~~~~~

Implements C#-Style Events.

Derived from the original work by Zoran Isailovski:

### 12.1 Variables

| Name                     | Description        |
|--------------------------|--------------------|
| <code>__package__</code> | <b>Value:</b> None |

### 12.2 Class `EventsException`

#### 12.2.1 Methods

*Inherited from `exceptions.Exception`*

`__init__()`, `__new__()`

*Inherited from `exceptions.BaseException`*

`__delattr__()`, `__getattr__()`, `__getitem__()`, `__getslice__()`, `__reduce__()`, `__repr__()`, `__setattr__()`, `__setstate__()`, `__str__()`, `__unicode__()`

*Inherited from `object`*

`__format__()`, `__hash__()`, `__reduce_ex__()`, `__sizeof__()`, `__subclasshook__()`

### 12.2.2 Properties

| Name                                                        | Description |
|-------------------------------------------------------------|-------------|
| <i>Inherited from <code>exceptions.BaseException</code></i> |             |
| <code>args</code> , <code>message</code>                    |             |
| <i>Inherited from object</i>                                |             |
| <code>__class__</code>                                      |             |

## 12.3 Class Events

Encapsulates the core to event subscription and event firing, and feels like a "natural" part of the language.

The class `Events` is there mainly for 3 reasons:

- Events (Slots) are added automatically, so there is no need to declare/create them separately. This is great for prototyping. (Note that `'__events__'` is optional and should primarily help detect misspelled event names.)
- To provide (and encapsulate) some level of introspection.
- To "steel the name" and hereby remove unneeded redundancy in a call like:

```
xxx.OnChange = event('OnChange')
```

### 12.3.1 Methods

|                                          |
|------------------------------------------|
| <code>__init__(self, events=None)</code> |
| <code>__getattr__(self, name)</code>     |
| <code>__repr__(self)</code>              |
| <code>__str__(self)</code>               |
| <code>__len__(self)</code>               |

|                             |
|-----------------------------|
| <code>__iter__(self)</code> |
|-----------------------------|

## 13 Package ethanol.events.tests

### 13.1 Modules

- **tests** (*Section 14, p. 42*)

### 13.2 Variables

| Name        | Description        |
|-------------|--------------------|
| __package__ | <b>Value:</b> None |

## 14 Module `ethanol.events.tests.tests`

### 14.1 Variables

| Name                     | Description                                       |
|--------------------------|---------------------------------------------------|
| <code>__package__</code> | <b>Value:</b> <code>'ethanol.events.tests'</code> |

### 14.2 Class `TestBase`

**Known Subclasses:** `ethanol.events.tests.tests.TestEventSlot`, `ethanol.events.tests.tests.TestEvents`, `ethanol.events.tests.tests.TestInstanceEvents`

#### 14.2.1 Methods

**`setUp(self)`**

Hook method for setting up the test fixture before exercising it.

Overrides: `unittest.case.TestCase.setUp` `exitit`(inherited documentation)

**`callback1(self)`**

**`callback2(self)`**

**`callback3(self)`**

***Inherited from `unittest.case.TestCase`***

`__call__()`, `__eq__()`, `__hash__()`, `__init__()`, `__ne__()`, `__repr__()`, `__str__()`, `addCleanup()`, `addTypeEqualityFunc()`, `assertAlmostEqual()`, `assertAlmostEquals()`, `assertDictContainsSubset()`, `assertDictEqual()`, `assertEqual()`, `assertEquals()`, `assertFalse()`, `assertGreater()`, `assertGreaterEqual()`, `assertIn()`, `assertIs()`, `assertIsInstance()`, `assertIsNone()`, `assertIsNot()`, `assertIsNotNone()`, `assertItemsEqual()`, `assertLess()`, `assertLessEqual()`, `assertListEqual()`, `assertMultiLineEqual()`, `assertNotAlmostEqual()`, `assertNotAlmostEquals()`, `assertNotEqual()`, `assertNotEquals()`, `assertNotIn()`, `assertNotIsInstance()`, `assertNotRegexpMatches()`,

assertRaises(), assertRaisesRegexp(), assertRegexpMatches(), assertSequenceEqual(), assertSetEqual(), assertTrue(), assertTupleEqual(), assert\_(), countTestCases(), debug(), defaultTestResult(), doCleanups(), fail(), failIf(), failIfAlmostEqual(), failIfEqual(), failUnless(), failUnlessAlmostEqual(), failUnlessEqual(), failUnlessRaises(), id(), run(), setUpClass(), shortDescription(), skipTest(), tearDown(), tearDownClass()

### ***Inherited from object***

\_\_delattr\_\_(), \_\_format\_\_(), \_\_getattr\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_setattr\_\_(), \_\_sizeof\_\_(), \_\_subclasshook\_\_()

#### **14.2.2 Properties**

| Name                                      | Description |
|-------------------------------------------|-------------|
| <i>Inherited from object</i><br>__class__ |             |

#### **14.2.3 Class Variables**

| Name                                                                 | Description |
|----------------------------------------------------------------------|-------------|
| <i>Inherited from unittest.case.TestCase</i><br>longMessage, maxDiff |             |

### **14.3 Class TestEvents**

#### **14.3.1 Methods**

|                              |
|------------------------------|
| <b>test__getattr__(self)</b> |
| <b>test__len__(self)</b>     |

|                              |
|------------------------------|
| <code>test_iter(self)</code> |
|------------------------------|

**Inherited from *ethanol.events.tests.tests.TestBase*(Section 14.2)**

`callback1()`, `callback2()`, `callback3()`, `setUp()`

**Inherited from *unittest.case.TestCase***

`__call__()`, `__eq__()`, `__hash__()`, `__init__()`, `__ne__()`, `__repr__()`, `__str__()`, `addCleanup()`, `addTypeEqualityFunc()`, `assertAlmostEqual()`, `assertAlmostEquals()`, `assertDictContainsSubset()`, `assertDictEqual()`, `assertEqual()`, `assertEquals()`, `assertFalse()`, `assertGreater()`, `assertGreaterEqual()`, `assertIn()`, `assertIs()`, `assertIsInstance()`, `assertIsNone()`, `assertIsNot()`, `assertIsNotNone()`, `assertItemsEqual()`, `assertLess()`, `assertLessEqual()`, `assertListEqual()`, `assertMultiLineEqual()`, `assertNotAlmostEqual()`, `assertNotAlmostEquals()`, `assertNotEqual()`, `assertNotEquals()`, `assertNotIn()`, `assertNotIsInstance()`, `assertNotRegexMatches()`, `assertRaises()`, `assertRaisesRegex()`, `assertRegexMatches()`, `assertSequenceEqual()`, `assertSetEqual()`, `assertTrue()`, `assertTupleEqual()`, `assert_()`, `countTestCases()`, `debug()`, `defaultTestResult()`, `doCleanups()`, `fail()`, `failIf()`, `failIfAlmostEqual()`, `failIfEqual()`, `failUnless()`, `failUnlessAlmostEqual()`, `failUnlessEqual()`, `failUnlessRaises()`, `id()`, `run()`, `setUpClass()`, `shortDescription()`, `skipTest()`, `tearDown()`, `tearDownClass()`

**Inherited from *object***

`__delattr__()`, `__format__()`, `__getattr__()`, `__new__()`, `__reduce__()`, `__reduce_ex__()`, `__setattr__()`, `__sizeof__()`, `__subclasshook__()`

### 14.3.2 Properties

| Name                         | Description |
|------------------------------|-------------|
| <i>Inherited from object</i> |             |
| <code>__class__</code>       |             |

### 14.3.3 Class Variables

| Name                                                | Description |
|-----------------------------------------------------|-------------|
| <i>Inherited from <i>unittest.case.TestCase</i></i> |             |
| <code>longMessage</code> , <code>maxDiff</code>     |             |

## 14.4 Class *TestEventSlot*

### 14.4.1 Methods

**setUp**(*self*)

Hook method for setting up the test fixture before exercising it.

Overrides: `unittest.case.TestCase.setUp` `exitit`(inherited documentation)

**test\_type**(*self*)

**test\_len**(*self*)

**test\_repr**(*self*)

**test\_iter**(*self*)

**test\_getitem**(*self*)

**test\_isub**(*self*)

*Inherited from `ethanol.events.tests.tests.TestBase` (Section 14.2)*

`callback1()`, `callback2()`, `callback3()`

*Inherited from `unittest.case.TestCase`*

`__call__()`, `__eq__()`, `__hash__()`, `__init__()`, `__ne__()`, `__repr__()`, `__str__()`, `addCleanup()`, `addTypeEqualityFunc()`, `assertAlmostEqual()`, `assertAlmostEquals()`, `assertDictContainsSubset()`, `assertDictEqual()`, `assertEqual()`, `assertEquals()`, `assertFalse()`, `assertGreater()`, `assertGreaterEqual()`, `assertIn()`, `assertIs()`, `assertIsInstance()`, `assertIsNone()`, `assertIsNot()`, `assertIsNotNone()`, `assertItemsEqual()`, `assertLess()`, `assertLessEqual()`, `assertListEqual()`, `assertMultiLineEqual()`, `assertNotAlmostEqual()`, `assertNotAlmostEquals()`, `assertNotEqual()`, `assertNotEquals()`, `assertNotIn()`, `assertNotIsInstance()`, `assertNotRegexpMatches()`,

assertRaises(), assertRaisesRegexp(), assertRegexpMatches(), assertSequenceEqual(), assertSetEqual(), assertTrue(), assertTupleEqual(), assert\_(), countTestCases(), debug(), defaultTestResult(), doCleanups(), fail(), failIf(), failIfAlmostEqual(), failIfEqual(), failUnless(), failUnlessAlmostEqual(), failUnlessEqual(), failUnlessRaises(), id(), run(), setUpClass(), shortDescription(), skipTest(), tearDown(), tearDownClass()

### ***Inherited from object***

\_\_delattr\_\_(), \_\_format\_\_(), \_\_getattr\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_setattr\_\_(), \_\_sizeof\_\_(), \_\_subclasshook\_\_()

#### **14.4.2 Properties**

| Name                                      | Description |
|-------------------------------------------|-------------|
| <i>Inherited from object</i><br>__class__ |             |

#### **14.4.3 Class Variables**

| Name                                                                 | Description |
|----------------------------------------------------------------------|-------------|
| <i>Inherited from unittest.case.TestCase</i><br>longMessage, maxDiff |             |

## **14.5 Class TestInstanceEvents**

### **14.5.1 Methods**

|                                                |
|------------------------------------------------|
| <code>test__getattr__(self)</code>             |
| <code>test__instance__restriction(self)</code> |

*Inherited from ethanol.events.tests.tests.TestBase(Section 14.2)*

callback1(), callback2(), callback3(), setUp()

### ***Inherited from unittest.case.TestCase***

\_\_call\_\_(), \_\_eq\_\_(), \_\_hash\_\_(), \_\_init\_\_(), \_\_ne\_\_(), \_\_repr\_\_(), \_\_str\_\_(), addCleanup(), addTypeEqualityFunc(), assertAlmostEqual(), assertAlmostEquals(), assertDictContainsSubset(), assertDictEqual(), assertEquals(), assertEquals(), assertFalse(), assertGreater(), assertGreaterEqual(), assertIn(), assertIs(), assertIsInstance(), assertIsNone(), assertIsNot(), assertIsNotNone(), assertItemsEqual(), assertLess(), assertLessEqual(), assertListEqual(), assertMultiLineEqual(), assertNotAlmostEqual(), assertNotAlmostEquals(), assertNotEqual(), assertNotEquals(), assertNotIn(), assertNotIsInstance(), assertNotRegexpMatches(), assertRaises(), assertRaisesRegexp(), assertRegexpMatches(), assertSequenceEqual(), assertSetEqual(), assertTrue(), assertTupleEqual(), assert\_(), countTestCases(), debug(), defaultTestResult(), doCleanups(), fail(), failIf(), failIfAlmostEqual(), failIfEqual(), failUnless(), failUnlessAlmostEqual(), failUnlessEqual(), failUnlessRaises(), id(), run(), setUpClass(), shortDescription(), skipTest(), tearDown(), tearDownClass()

### ***Inherited from object***

\_\_delattr\_\_(), \_\_format\_\_(), \_\_getattr\_\_(), \_\_new\_\_(), \_\_reduce\_\_(), \_\_reduce\_ex\_\_(), \_\_setattr\_\_(), \_\_sizeof\_\_(), \_\_subclasshook\_\_()

#### **14.5.2 Properties**

| Name                         | Description |
|------------------------------|-------------|
| <i>Inherited from object</i> |             |
| __class__                    |             |

#### **14.5.3 Class Variables**

| Name                                         | Description |
|----------------------------------------------|-------------|
| <i>Inherited from unittest.case.TestCase</i> |             |
| longMessage, maxDiff                         |             |

## 15 Package ethanol.graph\_coloring

This package contains some extra components.

`exact_color`: contains an exact graph coloring algorithm

### 15.1 Modules

- `exact_color`: Graph coloring  
(Section 16, p. 49)

### 15.2 Variables

| Name                     | Description                                              |
|--------------------------|----------------------------------------------------------|
| <code>__ALL__</code>     | <b>Value:</b> <code>['read_graph', 'color_graph']</code> |
| <code>__package__</code> | <b>Value:</b> <code>'ethanol.graph_coloring'</code>      |

## 16 Module *ethanol.graph\_coloring.exact\_color*

Graph coloring

**Author:** Henrique Moura

**Change Log:** April 04, 2017

**Requires:** networkx

### 16.1 Functions

|                                                                         |
|-------------------------------------------------------------------------|
| <code>assign_colors(<i>index_k</i>, <i>graph</i>, <i>colors</i>)</code> |
|-------------------------------------------------------------------------|

|                                                                    |
|--------------------------------------------------------------------|
| <code>coloring(<i>index_k</i>, <i>graph</i>, <i>colors</i>)</code> |
|--------------------------------------------------------------------|

|                                                |
|------------------------------------------------|
| algoritmo de coloracao exata ref.: puntambekar |
|------------------------------------------------|

|                                        |
|----------------------------------------|
| <code>color_graph(<i>graph</i>)</code> |
|----------------------------------------|

|                                          |
|------------------------------------------|
| <code>read_graph(<i>clq_file</i>)</code> |
|------------------------------------------|

### 16.2 Variables

| Name                     | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| <code>__ALL__</code>     | <b>Value:</b> [ <code>'read_graph'</code> , <code>'color_graph'</code> ] |
| <code>__package__</code> | <b>Value:</b> <code>'ethanol.graph_coloring'</code>                      |

## 17 Package ethanol.ovsdb

This package contains a python ovsdb client

### 17.1 Modules

- **ovsdb**: OVSDB calls.  
(Section 18, p. 51)

### 17.2 Variables

| Name        | Description        |
|-------------|--------------------|
| __package__ | <b>Value:</b> None |

## 18 Module ethanol.ovsdb.ovsdb

OVSDb calls. see more information in <https://tools.ietf.org/html/rfc7047>

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

### 18.1 Variables

| Name                     | Description                                |
|--------------------------|--------------------------------------------|
| <code>__package__</code> | <b>Value:</b> <code>'ethanol.ovsdb'</code> |

### 18.2 Class Ovsdb

#### 18.2.1 Methods

|                                                                            |
|----------------------------------------------------------------------------|
| <code>__init__(self, server_ip, server_port=6632, buffer_size=4096)</code> |
| <code>connect(self)</code><br>connect to the openvswitch ovsdb port        |
| <code>gather_data(self)</code><br>receive all json data                    |
| <code>echo(self)</code><br>perform an echo (ping) to the ovsdb             |
| <code>list_dbs(self)</code><br>list all databases                          |
| <code>monitor(self, db, columns, monitor_id=None, msg_id=None)</code>      |

|----------------------------------|
| return a list of all table names |
|----------------------------------|

### 18.2.2 Properties

| Name | Description                |
|------|----------------------------|
| id   | message id (autoincrement) |

## 19 Module `ethanol.server`

This is a pox module. It should be called using `pox.py`.

Command sample:

```
./pox.py ethanol.server
```

**Requires:** `construct` (<https://pypi.python.org/pypi/construct>)

**See Also:** more info at `msg_core.py`

### 19.1 Functions

|                                                                            |
|----------------------------------------------------------------------------|
| <code>run_server(server_address='0.0.0.0', server_port=SERVER_PORT)</code> |
|----------------------------------------------------------------------------|

|                                                                        |
|------------------------------------------------------------------------|
| creates an Ethanol server at <code>SERVER_PORT</code> and activates it |
|------------------------------------------------------------------------|

|                       |
|-----------------------|
| <code>launch()</code> |
|-----------------------|

|                                                 |

### 19.2 Class `ethanol_ap_server`

```

object └─ ethanol.server.ethanol_ap_server

```

Waits for OpenFlow switches to connect and saves their information to match with Ethanol AP.

#### 19.2.1 Methods

|                             |
|-----------------------------|
| <code>__init__(self)</code> |
|-----------------------------|

|                                                                                                        |
|--------------------------------------------------------------------------------------------------------|
| <code>x.__init__(...)</code> initializes <code>x</code> ; see <code>help(type(x))</code> for signature |
|--------------------------------------------------------------------------------------------------------|

|                                                                                       |
|---------------------------------------------------------------------------------------|
| Overrides: <code>object.__init__</code> <code>exitit</code> (inherited documentation) |
|---------------------------------------------------------------------------------------|

#### *Inherited from object*

```

__delattr__(), __format__(), __getattr__(), __hash__(), __new__(),
__reduce__(), __reduce_ex__(), __repr__(), __setattr__(), __sizeof__(),
__str__(), __subclasshook__()

```

### 19.2.2 Properties

| Name                                                   | Description |
|--------------------------------------------------------|-------------|
| <i>Inherited from object</i><br><code>__class__</code> |             |

## 20 Package `ethanol.ssl_message`

This package contains some components to implement Ethanol API. This module provides messaging capabilities to Ethanol using SSL sockets. This module is used by the ethanol classes.

See `msg_common.py` for the message types supported

### 20.1 Modules

- **enum** (*Section 21, p. 58*)
- **msg\_acs**: implements the following messages:  
(*Section 22, p. 59*)
- **msg\_ap\_broadcastssid**: implements the following messages:  
(*Section 23, p. 61*)
- **msg\_ap\_ctsprotection\_enabled**: implements the following messages:  
(*Section 24, p. 63*)
- **msg\_ap\_dtiminterval**: implements the following messages:  
(*Section 25, p. 65*)
- **msg\_ap\_frameburstenabled**: implements the following messages:  
(*Section 26, p. 67*)
- **msg\_ap\_guardinterval**: implements the following messages:  
(*Section 27, p. 69*)
- **msg\_ap\_in\_range**: implements the following messages:  
(*Section 28, p. 71*)
- **msg\_ap\_interferencemap**: implements the following messages:  
(*Section 29, p. 73*)
- **msg\_ap\_modes**: implements the following messages:  
(*Section 30, p. 74*)
- **msg\_ap\_rtsthreshold**: implements the following messages:  
(*Section 31, p. 75*)
- **msg\_ap\_ssid**: implements: \* `get_ap_ssids`  
(*Section 32, p. 77*)
- **msg\_association**: implements:  
(*Section 33, p. 79*)
- **msg\_beacon\_interval**: handles the beacon interval information: gets or sets it.  
(*Section 34, p. 81*)
- **msg\_bitrates**: implements the following messages:  
(*Section 35, p. 83*)
- **msg\_bye**: implements the BYE message  
(*Section 36, p. 86*)
- **msg\_changed\_ap**: implements the following messages:  
(*Section 37, p. 88*)
- **msg\_channelinfo**: implements the following messages:

(Section 38, p. 90)

- **msg\_channels**: implements the following messages:  
(Section 39, p. 92)
- **msg\_common**: this module contains important constants used throughout our implementation  
(Section 40, p. 95)
- **msg\_core**: All *ssl\_message* modules use python construct (<https://pypi.python.org/pypi/construct>).  
(Section 41, p. 98)
- **msg\_enabled**: implements the following messages:  
(Section 42, p. 100)
- **msg\_error**: error messages  
(Section 43, p. 102)
- **msg\_frequency**: implements the following messages:  
(Section 44, p. 103)
- **msg\_handle\_snr**: implements:  
(Section 45, p. 105)
- **msg\_hello**: basic hello message.  
(Section 46, p. 108)
- **msg\_hostapd\_conf**: configure hostapd.  
(Section 47, p. 110)
- **msg\_interfaces**: implements the following messages:  
(Section 48, p. 112)
- **msg\_log**: defines if our modules will use *pox.log* facility or python log facility  
(Section 49, p. 114)
- **msg\_mean\_stats**: implements the following messages:  
(Section 50, p. 115)
- **msg\_memcpu**: implements the following messages:  
(Section 51, p. 119)
- **msg\_metric**: implements:  
(Section 52, p. 121)
- **msg\_mlme**: implements the following MLME messages:  
(Section 53, p. 123)
- **msg\_mtu\_qlen**: implements: \* *set\_txqueuelen* \* *set\_mtu*  
(Section 54, p. 126)
- **msg\_ping**: implements:  
(Section 55, p. 128)
- **msg\_powersave**: implements the following messages:  
(Section 56, p. 130)
- **msg\_preamble**: implements: \* *get\_preamble* \* *set\_preamble*  
(Section 57, p. 132)
- **msg\_radio\_wlans**: implements the following messages:  
(Section 58, p. 134)
- **msg\_sent\_received**: implements the following messages:  
(Section 59, p. 136)

- **msg\_server**: this is creates the server, that deals with clients (aps and stations) messages the messages implemented are mapped in `map_msg_to_procedure` main entry to this module is: `call run(server)`  
(Section 60, p. 141)
- **msg\_snr\_power**: implements the following messages:  
(Section 61, p. 143)
- **msg\_ssid**: implements the following messages:  
(Section 62, p. 146)
- **msg\_sta\_link\_information**: implements the following messages:  
(Section 63, p. 148)
- **msg\_sta\_statistics**: implements the following messages:  
(Section 64, p. 150)
- **msg\_station\_trigger\_transition**: implements the following messages:  
(Section 65, p. 152)
- **msg\_statistics**: implements the following messages:  
(Section 66, p. 153)
- **msg\_tos**: implements the following messages:  
(Section 67, p. 155)
- **msg\_uptime**: implements the following messages:  
(Section 68, p. 157)
- **msg\_wlan\_info**: implements: \* `req_wlan_info()`: MSG\_WLAN\_INFO  
(Section 69, p. 158)

## 20.2 Variables

| Name                     | Description        |
|--------------------------|--------------------|
| <code>__package__</code> | <b>Value:</b> None |

## 21 Module ethanol.ssl\_message.enum

### 21.1 Functions

|                                                       |
|-------------------------------------------------------|
| <b>Enums</b> (* <i>sequential</i> , ** <i>named</i> ) |
| helper function - creates an enumeration              |

### 21.2 Variables

| Name                     | Description        |
|--------------------------|--------------------|
| <code>__package__</code> | <b>Value:</b> None |

### 21.3 Class Enum

helper function - creates an enumeration

```
> Number = Enum('a', 'b', 'c') > print Number.a 0
```

#### 21.3.1 Methods

|                                                       |
|-------------------------------------------------------|
| <code>__init__</code> ( <i>self</i> , * <i>keys</i> ) |
|-------------------------------------------------------|

## 22 Module `ethanol.ssl_message.msg_acs`

implements the following messages:

\* `get_acs`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 22.1 Functions

```
get_acs(server, id=0, intf_name=None, sta_ip=None, sta_port=0,
num_tests=1)
```

request the ap to provide ACS information

#### Parameters

|                         |                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>server:</code>    | tuple (ip, port_num)                                                                                                            |
| <code>id:</code>        | message id                                                                                                                      |
| <code>intf_name:</code> | name of the wireless interface<br>( <i>type=</i> str)                                                                           |
| <code>sta_ip:</code>    | ip address of a station to which this message should be relayed. If None don't relay message, server should process the request |
| <code>sta_port:</code>  | socket port of the station                                                                                                      |
| <code>num_tests:</code> | number of tests (greater than or equal to 1) that should be executed                                                            |
| <code>num_tests:</code> | int                                                                                                                             |

### 22.2 Variables

| Name             | Description                                                                   |
|------------------|-------------------------------------------------------------------------------|
| msg_acs          | <b>Value:</b> Struct('msg_ap_in_range',<br>Embed(msg_default), Embed(field... |
| ACS_SCALE_FACTOR | <b>Value:</b> 1000000000000000000.0                                           |

## 23 Module `ethanol.ssl_message.msg_ap_broadcastssid`

implements the following messages:

\* `get_acs`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 23.1 Functions

|                                                                         |
|-------------------------------------------------------------------------|
| <code>get_broadcastssid(server, id=0, intf_name=None, ssid=None)</code> |
| verify is the interface is broadcasting the SSID                        |
| <b>Parameters</b>                                                       |
| <b>server:</b> tuple (ip, port_num)                                     |
| <b>id:</b> message id                                                   |
| <b>intf_name:</b> name of the wireless interface                        |
| ( <i>type=str</i> )                                                     |

```
set__broadcastssid(server, id=0, intf_name=None, enable=False,
ssid=None)
```

enable or disable the broadcasting of the SSID

omitted fieldlist **Parameters**

**id:** message id

**intf\_name:** name of the wireless interface  
(*type=*str)

**enable:** set if the SSID should be broadcasted or if it is a  
hidden SSID

**enable:** bool

## 23.2 Variables

| Name                 | Description                                                                   |
|----------------------|-------------------------------------------------------------------------------|
| msg_ap_broadcastssid | <b>Value:</b> Struct('msg_ap_broadcastssid',<br>Embed(msg_default), Embed(... |

## 24 Module *ethanol.ssl\_message.msg\_ap\_ctsprotection\_enabled*

implements the following messages:

\* *get\_ctsprotection\_enabled*

\* *set\_ctsprotection\_enabled*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 24.1 Functions

|                                                                                                 |
|-------------------------------------------------------------------------------------------------|
| <b><i>get_ctsprotection_enabled</i></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| Verify if RTS/CTS mechanism is activated                                                        |
| <b>Parameters</b>                                                                               |
| <b>server:</b> tuple (ip, port_num)                                                             |
| <b>id:</b> message id                                                                           |
| <b>intf_name:</b> name of the wireless interface.                                               |
| ( <i>type</i> = <i>str</i> )                                                                    |

```
set_ctsprotection_enabled(server, id=0, intf_name=None,
enable=False)
```

enable or disable RTS/CTS mechanism

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface.  
*(type=str)*  
**enable:** true activates RTS/CTS mechanism  
**enable:** bool

## 24.2 Variables

| Name                      | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| msg_ctsprotection_enabled | <b>Value:</b> Struct('ctsprotection_enabled', Embed(msg_default), Embed... |

## 25 Module `ethanol.ssl_message.msg_ap_dtiminterval`

implements the following messages:

\* `set_ap_dtiminterval`

\* `get_ap_dtiminterval`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 25.1 Functions

|                                                                                                 |
|-------------------------------------------------------------------------------------------------|
| <b><code>get_ap_dtiminterval</code></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| get the DTIM interval set in the interface <i>intf_name</i>                                     |
| <b>Parameters</b>                                                                               |
| <b><i>server</i>:</b> tuple (ip, port_num)                                                      |
| <b><i>id</i>:</b> message id                                                                    |
| <b><i>intf_name</i>:</b> name of the wireless interface                                         |
| ( <i>type</i> = <i>str</i> )                                                                    |

```
set_ap_dtiminterval(server, id=0, intf_name=None, dtim_interval=100)
```

set the DTIM interval of the interface *intf\_name*

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**dtim\_interval:** DTIM interval  
*(type=int)*

**Note:** <https://routerguide.net/dtim-interval-period-best-setting/>

## 25.2 Variables

**Status:** in development

**Requires:** construct 2.5.2

### 26.1 Functions

|                                                                                                |
|------------------------------------------------------------------------------------------------|
| <b><i>get_ap_frameburstenabled</i></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| if frame burst is enabled                                                                      |
| <b>Parameters</b>                                                                              |
| <b>server:</b> tuple (ip, port_num)                                                            |
| <b>id:</b> message id                                                                          |
| <b>intf_name:</b> name of the wireless interface                                               |
| ( <i>type=</i> str)                                                                            |

```
set_ap_frameburstenabled(server, id=0, intf_name=None,
enabled=False)
```

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**enabled:** enables or disables frame burst  
*(type=bool)*

## 26.2 Variables

| Name                     | Description                                                                      |
|--------------------------|----------------------------------------------------------------------------------|
| msg_ap_frameburstenabled | <b>Value:</b><br>Struct('msg_ap_frameburstenabled',<br>Embed(msg_default), Em... |

## 27 Module *ethanol.ssl\_message.msg\_ap\_guardinterval*

implements the following messages:

\* *get\_ap\_guardinterval*

\* *set\_ap\_guardinterval*

no process is implemented: the controller is not supposed to respond to these message

### 27.1 Functions

|                                                                                            |
|--------------------------------------------------------------------------------------------|
| <b><i>get_ap_guardinterval</i></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| get the guard interval set in the interface <i>intf_name</i>                               |
| <b>Parameters</b>                                                                          |
| <b><i>server</i>:</b> tuple (ip, port_num)                                                 |
| <b><i>id</i>:</b> message id                                                               |
| <b><i>intf_name</i>:</b> name of the wireless interface                                    |
| ( <i>type</i> = <i>str</i> )                                                               |

```
set_ap_guardinterval(server, id=0, intf_name=None,
guard_interval=100)
```

set the guard interval of the interface `intf_name`

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**guard\_interval:** time used as guard interval between transmissions  
*(type=int)*

## 27.2 Variables

| Name                              | Description                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------|
| <code>msg_ap_guardinterval</code> | <b>Value:</b> <code>Struct('msg_ap_guardinterval',<br/>Embed(msg_default), Embed(...</code> |

## 28 Module `ethanol.ssl_message.msg_ap_in_range`

implements the following messages:

\* `get_ap_in_range`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 28.1 Functions

```
get_ap_in_range(server, id=0, intf_name=None, sta_ip=None,
sta_port=0)
```

request the ap or the client to try to detect the aps in range, using 802.11 scanning capability

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=*str)  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=*str)  
**sta\_port:** socket port number of the station  
(*type=*int)

#### Return Value

msg, num\_aps, aps the received message (a Container), the number of aps in range, a list of aps (ap\_in\_range struct)

## 28.2 Variables

| Name            | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| ap_in_range     | <b>Value:</b> Struct('ap_in_range',<br>Embed(field_intf_name), Embed(field... |
| msg_ap_in_range | <b>Value:</b> Struct('msg_ap_in_range',<br>Embed(msg_default), Embed(field... |

## 29 Module *ethanol.ssl\_message.msg\_ap\_interferencemap*

implements the following messages:

\* `get_ap_interferenceMap`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 29.1 Functions

|                                                                     |
|---------------------------------------------------------------------|
| <code>get_ap_interferenceMap(server, m_id=0, intf_name=None)</code> |
|---------------------------------------------------------------------|

### 29.2 Variables

| Name                     | Description        |
|--------------------------|--------------------|
| <code>__package__</code> | <b>Value:</b> None |

### 30 Module *ethanol.ssl\_message.msg\_ap\_modes*

implements the following messages:

\* `get_ap_supported_intf_modes`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

#### 30.1 Functions

|                                                                                               |
|-----------------------------------------------------------------------------------------------|
| <code>get_ap_supported_intf_modes(<i>server</i>, <i>m_id</i>=0, <i>intf_name</i>=None)</code> |
|-----------------------------------------------------------------------------------------------|

#### 30.2 Variables

| Name                     | Description        |
|--------------------------|--------------------|
| <code>__package__</code> | <b>Value:</b> None |

## 31 Module `ethanol.ssl_message.msg_ap_rtsthreshold`

implements the following messages:

\* `get_ap_rtsthreshold`

\* `set_ap_rtsthreshold`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 31.1 Functions

|                                                                                                 |
|-------------------------------------------------------------------------------------------------|
| <b><code>get_ap_rtsthreshold</code></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| verify is the interface is broadcasting the SSID                                                |
| <b>Parameters</b>                                                                               |
| <b>server:</b> tuple (ip, port_num)                                                             |
| <b>id:</b> message id                                                                           |
| <b>intf_name:</b> name of the wireless interface                                                |
| ( <i>type=</i> str)                                                                             |
| <b>Return Value</b>                                                                             |
| msg, value                                                                                      |

```
set_ap_rtsthreshold(server, id=0, intf_name=None, rts_threshold=0)
```

enable or disable the broadcasting of the SSID

#### Parameters

**server:** tuple (ip, port\_num)

**id:** message id

**intf\_name:** name of the wireless interface

(*type*=str)

### 31.2 Variables

| Name                | Description                                                                   |
|---------------------|-------------------------------------------------------------------------------|
| msg_ap_rtsthreshold | <b>Value:</b> Struct('msg_ap_rtsthreshold',<br>Embed(msg_default), Embed(f... |

## 32 Module `ethanol.ssl_message.msg_ap_ssid`

implements: \* `get_ap_ssids`

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** `construct 2.5.2`

### 32.1 Functions

```
get_ap_ssids(server, id=0, sta_ip=None, sta_port=0, intf_names=[])
```

returns the channel and frequency of the ssid for each `intf_names`

#### Parameters

|                    |                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>server:</b>     | tuple (ip, port_num)                                                                                                                                   |
| <b>id:</b>         | message id                                                                                                                                             |
| <b>intf_names:</b> | names of the wireless interface<br>( <i>type=list of str</i> )                                                                                         |
| <b>sta_ip:</b>     | ip address of the station that this message should be<br>relayed to, if <code>sta_ip</code> is different from <code>None</code><br>( <i>type=str</i> ) |
| <b>sta_port:</b>   | socket port number of the station<br>( <i>type=int</i> )                                                                                               |

### 32.2 Variables

| Name                   | Description                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ssid_info</code> | information about the configured SSID: wiphy, ESSID, channel, frequency, mode<br><b>Value:</b> <code>Struct('ssid_info', Embed(field_intf_name), Embed(field_s...</code> |

### 34.1 Functions

|                                                                                                 |
|-------------------------------------------------------------------------------------------------|
| <b><code>get_beacon_interval</code></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| get beacon interval in miliseconds for the interface <i>intf_name</i>                           |
| <b>Parameters</b>                                                                               |
| <b><i>server</i>:</b> tuple (ip, port_num)                                                      |
| <b><i>id</i>:</b> message id                                                                    |
| <b><i>intf_name</i>:</b> name of the wireless interface                                         |
| ( <i>type</i> =str)                                                                             |
| <b>Return Value</b>                                                                             |
| -1 if an error occurs                                                                           |

```
set_beacon_interval(server, id=0, intf_name=None,
beacon_interval=100)
```

set the beacon interval (in ms) default = 100ms different brands and models offer different allowable beacon interval ranges

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**beacon\_interval:** *(type=int)*

## 34.2 Variables

| Name                | Description                                                                  |

| ERROR               | <b>Value:</b> -1                                                             |

## 35 Module *ethanol.ssl\_message.msg\_bitrates*

implements the following messages:

- \* MSG\_GET\_TX\_BITRATES: *get\_tx\_bitrates*
- \* MSG\_GET\_TX\_BITRATE : *get\_tx\_bitrate*
- \* MSG\_SET\_TX\_BITRATES: TODO

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 35.1 Functions

***get\_tx\_bitrates***(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

get the channels the interface *intf\_name* supports, this function applies to access points

**Parameters**

- server:** tuple (ip, port\_num)
- id:** message id
- intf\_name:** name of the wireless interface  
(*type=str*)
- sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)
- sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

a dictionary, the index is the band

```
get_tx_bitrate(server, id=0, intf_name=None, sta_ip=None, sta_port=0,
sta_mac=None)
```

get the channels the interface `intf_name` supports, applies to access points

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**sta\_ip:** ip address of the station that this message should be relayed to, if `sta_ip` is different from `None`  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**sta\_mac:** if `None`, scan for all stations. If specified (str with MAC address dotted format), returns only the station, if connected

```
set_tx_bitrate(server, id=0, intf_name=None, sta_ip=None, sta_port=0,
band_type=None, bitrates=None)
```

runs in the device the command `sudo iw dev wlan0 set bitrates legacy_<band> <bitrates>*`

```
set_mcs_indexes(server, id=0, intf_name=None, sta_ip=None,
sta_port=0, index=None, index_values=None)
```

runs in the device the command `sudo iw dev wlan0 set bitrates <mcs index type> <index_values>*`

## 36 Module `ethanol.ssl_message.msg_bye`

implements the BYE message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 36.1 Functions

|                                                                            |
|----------------------------------------------------------------------------|
| <b>send_msg_bye</b> ( <i>server</i> , <i>id</i> =0, <i>tcp_port</i> =None) |
|----------------------------------------------------------------------------|

disconnects the ethanol device from the controller

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

**tcp\_port:** socket port number of the device  
(*type=int*)

|                                                              |
|--------------------------------------------------------------|
| <b>process_bye</b> ( <i>received_msg</i> , <i>fromaddr</i> ) |
|--------------------------------------------------------------|

returns the message to the ssl server process. nothing to be done, only send back the same message

**Parameters**

**func\_bye:** event

|                                                |
|------------------------------------------------|
| <b>bogus_bye_on_change</b> (** <i>kwargs</i> ) |
|------------------------------------------------|

### 36.2 Variables

| Name       | Description                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| events_bye | to handle a receiving bye messages, just add your function to events_bye your function must use 'def my_func(**kwargs)' signature for compatibility<br><b>Value:</b> Events() |
| msg_bye    | <b>Value:</b> Struct('msg_bye',<br>Embed(msg_default),<br>SLInt32('tcp_port'),)                                                                                               |

## 37 Module `ethanol.ssl_message.msg_changed_ap`

implements the following messages:

\* `changed_ap`

\* `process_changed_ap`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 37.1 Functions

|                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------|
| <b>changed_ap</b> ( <i>server</i> , <i>id</i> =0, <i>status</i> =0, <i>current_ap</i> =None, <i>intf_name</i> =None) |
| verify is the interface is broadcasting the SSID                                                                     |
| <b>Parameters</b>                                                                                                    |
| <b>server:</b> tuple (ip, port_num)                                                                                  |
| <b>id:</b> message id                                                                                                |
| <b>intf_name:</b> names of the wireless interface<br>( <i>type=list of str</i> )                                     |
| <b>status:</b> inform the status of the operation (result from change<br>ap operation)<br>( <i>type=int</i> )        |
| <b>current_ap:</b> MAC address of the ap<br>( <i>type=str</i> )                                                      |

```
process_hello(received_msg, fromaddr)
```

for now, only logs the information

#### Parameters

**received\_msg**: stream of bytes to be decoded

**fromaddr**: IP address from the device that sent this message

## 37.2 Variables

| Name             | Description                                                                |

| msg_changed_ap   | <b>Value:</b> Struct('msg_changed_ap', Embed(msg_default), Embed(field_... |

## 38 Module *ethanol.ssl\_message.msg\_channelinfo*

implements the following messages:

\* MSG\_GET\_CHANNELINFO: `get_channelinfo`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 38.1 Functions

```
get_channelinfo(server, id=0, intf_name=None, channel=0,  
only_channel_in_use=False)
```

get the channels the interface `intf_name` supports, this function applies to access points

**Parameters**

|                             |                                                                |
|-----------------------------|----------------------------------------------------------------|
| <b>server:</b>              | tuple (ip, port_num)                                           |
| <b>id:</b>                  | message id                                                     |
| <b>intf_name:</b>           | names of the wireless interface<br>( <i>type=list of str</i> ) |
| <b>channel:</b>             | specify a channel to scan<br>( <i>type=int</i> )               |
| <b>only_channel_in_use:</b> | return only the channel in use<br>( <i>type=bool</i> )         |

**Return Value**

msg - received message a list

### 38.2 Variables

| Name            | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| channel_info    | <b>Value:</b> Struct('channel_info',<br>ULInt32('frequency'), SLInt8('in_u... |
| msg_channelinfo | <b>Value:</b> Struct('msg_channelinfo',<br>Embed(msg_default), Embed(field... |

## 39 Module *ethanol.ssl\_message.msg\_channels*

implements the following messages:

- \* *get\_channels*
- \* *get\_currentchannel*
- \* *set\_currentchannel*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 39.1 Functions

|                                                                                    |
|------------------------------------------------------------------------------------|
| <b><i>get_channels</i></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None) |
| get the channels the interface <i>intf_name</i> supports, applies to access points |
| <b>Parameters</b>                                                                  |
| <b>server:</b> tuple (ip, port_num)                                                |
| <b>id:</b> message id                                                              |
| <b>intf_name:</b> names of the wireless interface                                  |
| ( <i>type=list of str</i> )                                                        |
| <b>Return Value</b>                                                                |
| msg - received message                                                             |

---

```
get_currentchannel(server, id=0, intf_name=None, sta_ip=None,
                    sta_port=0)
```

---

get the channel the interface is configured to use . You can ask the AP to relay this request to the station if (sta\_ip, sta\_port) is provided

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
                   (*type=list of str*)  
**sta\_ip:** ip address of the station that this message should be  
                   relayed to, if sta\_ip is different from None  
                   (*type=str*)  
**sta\_port:** socket port number of the station  
                   (*type=int*)

**Return Value**

msg - received message

---

```
set_currentchannel(server, id=0, channel=None, intf_name=None,
                    sta_ip=None, sta_port=0)
```

---

set the current channel to channel

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
                   (*type=list of str*)  
**sta\_ip:** ip address of the station that this message should be  
                   relayed to, if sta\_ip is different from None  
                   (*type=str*)  
**sta\_port:** socket port number of the station  
                   (*type=int*)

**Return Value**

msg - received message

## 39.2 Variables

| Name               | Description                                                                    |

## 40 Module `ethanol.ssl_message.msg_common`

this modules contains important constants use throught out our implementation

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 40.1 Functions

|                                              |
|----------------------------------------------|
| <code>tri_boolean(<i>v</i>, <i>d</i>)</code> |
|----------------------------------------------|

|                                    |
|------------------------------------|
| <code>hexadecimal(<i>s</i>)</code> |
|------------------------------------|

|                                                |
|------------------------------------------------|
| converts a string of bytes to a string of hexa |
|------------------------------------------------|

**connect\_ssl\_socket(*server*)**

creates a ssl socket to server

@param *server*: is a tuple (ip, port)

if you are using Ubuntu 14.04 LTS, maybe it cannot update to 2.7.9 by its own  
you will need to insert a PPA repository  
type the following commands:

```
sudo add-apt-repository ppa:jonathonf/python-2.7
sudo apt-get -y update
sudo apt-get -y upgrade
sudo apt-get install python2.7
```

try:

```
context = ssl.SSLContext(ssl.PROTOCOL_SSLv3)
context.set_ciphers("AES256-SHA")
```

except AttributeError:

```
import sys
```

```
raise Exception('SSLContext needs Python 2.7.9 - version detected %s' % sys.version)
```

```
return None, None
```

**is\_error\_msg(*received\_msg*)****get\_error\_msg(*received\_msg*)****send\_and\_receive\_msg(*server*, *msg\_struct*, *builder*, *parser*,  
*only\_send*=False)**

generic function to send and receive message

**Parameters**

*server*: (serverIp, serverPort)

*msg\_struct*: Container with message fields

*builder*: Struct.build

*parser*: Struc.parse this Struct class must be able to interpret  
Container fields

**Return Value**

error : false if something goes wrong *msg* : a Container with the  
message

**len\_of\_string(*v*)**

```
return_from_dict(d, v, error)
```

## 40.2 Variables

| Name                   | Description                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| SERVER_ADDR            | this is the default address our server is going to bind for tests, connect only to the loopback interface if you want to connect to all available interfaces, use "0.0.0.0"<br><b>Value:</b> "localhost" |
| SERVER_PORT            | this is the default port used in the AP the port in the station is SERVER_PORT+1 (by default)<br><b>Value:</b> 22222                                                                                     |
| BUFFER_SIZE            | size of the buffer used by the python socket<br><b>Value:</b> 65536                                                                                                                                      |
| MSG_ERROR_TYPE         | constantes usadas para definição de erro de mensagens usadas no campo error_type in msg_error.py<br><b>Value:</b> Enum('ERROR_UNKNOWN', 'ERROR_VERSION_MISMATCH', 'ERROR_PR...)                          |
| DEFAULT_WIFI_INTF-NAME | <b>Value:</b> 'wlan0'                                                                                                                                                                                    |

## 41 Module `ethanol.ssl_message.msg_core`

All `ssl_modules` use `python construct` (<https://pypi.python.org/pypi/construct>). To install this module:

```
wget -c https://pypi.python.org/packages/source/c/construct/construct-2.5.2.tar.gz tar zxvf
construct-2.5.2.tar.gz cd construct-2.5.2 sudo ./setup.py install
```

**See Also:** documentation at <http://construct.readthedocs.io/en/latest/>

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** [henriquemoura@hotmail.com](mailto:henriquemoura@hotmail.com)

**Since:** July 2015

**Status:** in development

**Requires:** `construct 2.5.2`

### 41.1 Functions

|                                                                                          |
|------------------------------------------------------------------------------------------|
| <b>toHex</b> ( <i>s</i> )                                                                |
| <b>Parameters</b><br><i>s</i> : is a number stored in an string                          |
| <b>Return Value</b><br>a string, each byte of <i>s</i> is coded as a two char hex string |

|                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------|
| <b>int32_to_bytes</b> ( <i>i</i> , <i>endian</i> ='1')                                                                  |
| helper function to <code>BooleanFlag()</code> returns boolean value coded as string of 4 bytes default is little endian |

|                                                                                                         |
|---------------------------------------------------------------------------------------------------------|
| <b>BooleanFlag</b> ( <i>name</i> , <i>truth_value</i> =1, <i>false_value</i> =0, <i>default</i> =False) |
| Defines a Construct boolean type. The flag is coded as a 32 bit value                                   |

|                                                                                         |
|-----------------------------------------------------------------------------------------|
| <b>decode__default__fields</b> ( <i>received_msg</i> )                                  |
| handles the default header of all ethanol's messages                                    |
| <b>Parameters</b>                                                                       |
| <b>received_msg</b> : byte stream to be decoded (parsed) using construct message struct |

## 41.2 Variables

| Name                         | Description                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>msg_default</code>     | default message structure to be embedded in the first part of every message<br><b>Value:</b> <code>Struct('msg_default')</code>          |
| <code>field_intf_name</code> | handles an interface name field (a C char * field)<br><b>Value:</b> <code>Struct('_intf_name')</code>                                    |
| <code>field_mac_addr</code>  | handles a mac address field (a C char * field)<br><b>Value:</b> <code>Struct('mac_addr')</code>                                          |
| <code>field_ssid</code>      | handles a ssid field (a C char * field)<br><b>Value:</b> <code>Struct('ssid')</code>                                                     |
| <code>field_station</code>   | handles a station IP address (a C char * field), and its port (a C int field)<br><b>Value:</b> <code>Struct('station_connection')</code> |
| <code>__package__</code>     | <b>Value:</b> <code>'ethanol.ssl_message'</code>                                                                                         |

## 42 Module *ethanol.ssl\_message.msg\_enabled*

implements the following messages:

\* *is\_802\_11e\_enabled*

\* *is\_fastbsstransition\_compatible*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 42.1 Functions

```
is_802_11e_enabled(server, id=0, intf_name=DEFAULT_WIFI_INTFNAME,
sta_ip=None, sta_port=0)
```

verifies if 802.11e is supported and is enabled

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
*(type=list of str)*  
**sta\_ip:** ip address of the station that this message should be  
relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

#### Return Value

msg - received message

```
is_fastbsstransition_compatible(server, id=0,  
intf_name=DEFAULT_WIFI_INTFNAME, sta_ip=None, sta_port=0)
```

checks if the interface supports fast BSS transition feature

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
*(type=list of str)*  
**sta\_ip:** ip address of the station that this message should be  
 relayed to, if sta\_ip is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

#### Return Value

msg - received message

## 42.2 Variables

| Name        | Description                                                                   |
|-------------|-------------------------------------------------------------------------------|
| msg_enabled | <b>Value:</b> Struct('msg_enabled',<br>Embed(msg_default), Embed(field_int... |

## 43 Module *ethanol.ssl\_message.msg\_error*

error messagens

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 43.1 Functions

```
return_error_msg_struct(m_id,  
error_type=MSG_ERROR_TYPE.ERROR_UNKNOWN)
```

return error message as an array of bytes

**Parameters**

*id*: message id

**Return Value**

*msg* - received message

```
process_msg_not_implemented(received_msg, fromaddr)
```

generates an error message for the case where the process procedure is not implemented in Python returns an error

(not implemented)

### 43.2 Variables

| Name                   | Description                                                                       |
|------------------------|-----------------------------------------------------------------------------------|
| <code>msg_error</code> | <b>Value:</b> Struct('msg_error',<br>Embed(msg_default),<br>SLInt32('error_ty...' |

## 44 Module *ethanol.ssl\_message.msg\_frequency*

implements the following messages:

\* *get\_frequency*

\* *set\_frequency*

no process is implemented: the controller is not supposed to answer these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 44.1 Functions

```
get_frequency(server, id=0, intf_name=None, sta_ip=None, sta_port=0)
```

the interface is configured to use the frequency returned by this function  
can ask the AP to relay this request to the station if (sta\_ip, sta\_port) is provided

@param server: tuple (ip, port\_num)

@param id: message id

@param intf\_name: name of the wireless interface

@type intf\_name: str

@param sta\_ip: ip address of the station that this message should be relayed to, if provided

@type sta\_ip: str

@param sta\_port: socket port number of the station

@type sta\_port: int

@return: msg - received message

```
set_currentchannel(server, id=0, frequency=None, intf_name=None,
sta_ip=None, sta_port=0)
```

set the current frequency to value provided by the parameter "frequency"

#### Parameters

**frequency:** new channel based on frequency  
*(type=int)*

**server:** tuple (ip, port\_num)

**id:** message id

**intf\_name:** name of the wireless interface  
*(type=str)*

**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
*(type=str)*

**sta\_port:** socket port number of the station  
*(type=int)*

#### Return Value

msg - received message

## 44.2 Variables

| Name          | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| msg_frequency | <b>Value:</b> Struct('msg_frequency',<br>Embed(msg_default), Embed(field_s... |

## 45 Module *ethanol.ssl\_message.msg\_handle\_snr*

implements:

\* *snr\_threshold\_interval\_reached* and *process\_snr\_threshold*

\* *set\_snr\_threshold\_interval*

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 45.1 Functions

|                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>snr_threshold_reached</i></b> ( <i>server</i> , <i>id</i> =0, <i>sta_ip</i> =None, <i>sta_port</i> =0, <i>sta_mac</i> =None, <i>intf_name</i> =None, <i>mac_ap</i> =None, <i>snr</i> =None) |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

send information to controller. this implementation will 'never' be used in its python form

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

|                                                                               |
|-------------------------------------------------------------------------------|
| <b><i>process_snr_threshold</i></b> ( <i>received_msg</i> , <i>fromaddr</i> ) |
|-------------------------------------------------------------------------------|

|                                                                         |
|-------------------------------------------------------------------------|
| <b><i>bogus_snr_threshold_reached_on_change</i></b> (** <i>kwargs</i> ) |
|-------------------------------------------------------------------------|

```
snr_threshold_interval_reached(server, id=0, sta_ip=None,
sta_port=0, intf_name=None, interval=10)
```

set the time between SNR scans in the station.

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**interval:** interval in milliseconds  
*(type=int)*

```
set_snr_threshold(server, id=0, sta_ip=None, sta_port=0,
intf_name=None, threshold=10)
```

set the SNR threshold in dBm. Send message to a station.

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**threshold:** SNR threshold in dBm

## 45.2 Variables

| Name                         | Description                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| events_snr_threshold_reached | to handle a receiving snr_threshold_reached message, just add your function to events_snr_threshold_reached your function must use 'def my_func(**kwargs)' signature for compatibility<br><b>Value:</b> Events() |

## 47 Module *ethanol.ssl\_message.msg\_hostapd\_conf*

configure hostapd. Implements:

\* `get_hostapd_conf()`

\* `set_hostapd_conf()`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 47.1 Functions

|                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------|
| <b><code>get_hostapd_conf</code></b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None, <i>conf_param</i> =None) |
| get beacon interval in miliseconds for the interface <i>intf_name</i>                                                 |
| <b>Parameters</b>                                                                                                     |
| <b><i>server</i>:</b> tuple (ip, port_num)                                                                            |
| <b><i>id</i>:</b> message id                                                                                          |
| <b><i>intf_name</i>:</b> name of the wireless interface                                                               |
| ( <i>type</i> =str)                                                                                                   |
| <b>Return Value</b>                                                                                                   |
| -1 if an error occurs                                                                                                 |

```
set_hostapd_conf(server, id=0, intf_name=None, conf_param=None,
conf_value=None)
```

set the beacon interval (in ms) default = 100ms different brands and models offer different allowable beacon interval ranges

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*

### 50.1 Functions

```
send_msg_mean_sta_statistics(server, id=0, sta_ip=None, sta_port=0)
```

#### Parameters

- server:** tuple (ip, port\_num)
- id:** message id
- sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=*str)
- sta\_port:** socket port number of the station  
(*type=*int)

#### Return Value

msg - received message

```
send_msg_mean_sta_statistics_interface_add(server, id=0,  
sta_ip=None, sta_port=0, intf_name=None)
```

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**intf\_name:** name of the wireless interface you want to get statistics from  
*(type=str)*

**Return Value**

msg - received message

```
send_msg_mean_sta_statistics_interface_remove(server, id=0,  
sta_ip=None, sta_port=0, intf_name=None)
```

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**intf\_name:** name of the wireless interface you want to remove from pool  
*(type=str)*

**Return Value**

msg - received message

```
send_msg_mean_sta_statistics_alpha(server, id=0, sta_ip=None,
sta_port=0, alpha=0.1)
```

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**alpha:** alpha from EWMA  
*(type=float)*

**Return Value**

msg - received message

```
send_msg_mean_sta_statistics_time(server, id=0, sta_ip=None,
sta_port=0, msec=100)
```

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**msec:** statistics are collected during "msec" interval  
*(type=int)*

**Return Value**

msg - received message

| MLME-QOS-MAP.request AP to transmit an unsolicited QoS Map Configure frame to a specified STA |
|-----------------------------------------------------------------------------------------------|

|                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>scan_request</b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None, <i>bssid</i> =None, <i>mac_station</i> =None, <i>configs</i> =None) |
|-------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------|
| MLME-SCAN.request This primitive requests a survey of potential BSSs that the STA can later elect to try to join. |
|-------------------------------------------------------------------------------------------------------------------|

|                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| config is a dictionary with the following fields (optional): BSSType, BSSID, SSID, ScanType, ProbeDelay, ChannelList, MinChannelTime, MaxChannelTime, RequestInformation, SSID List, ChannelUsage, AccessNetworkType, HESSID, MeshID, DiscoveryMode |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------|
| <b>channel_measurement</b> ( <i>server</i> , <i>id</i> =0, <i>intf_name</i> =None, <i>bssid</i> =None, <i>mac_station</i> =None) |
|----------------------------------------------------------------------------------------------------------------------------------|

|                      |
|----------------------|
| MLME-MEASURE.request |
|----------------------|

**channel\_switch**(*server*, *id*=0, *intf\_name*=None, *bssid*=None, *mac\_station*=None, *configs*=None)

MLME-CHANNELSWITCH.request requests a switch to a new operating channel. waits the response or timeout

config is a dictionary with the following fields. All optional, except "Channel Number" Mode, Channel Number, Secondary Channel Offset, Channel Switch Count, Mesh Channel Switch Parameters, Wide Bandwidth Channel Switch, New Transmit Power Envelope

**neighbor\_report**(*server*, *id*=0, *intf\_name*=None, *bssid*=None, *mac\_station*=None)

start with MLME-NEIGHBORPREP.request and manages the whole process, until MLME-NEIGHBORRESP.indication

requests that a Neighbor Report Request frame be sent to the AP with which the STA is associated.

waits the response or timeout

**link\_measurement**(*server*, *id*=0, *intf\_name*=None, *bssid*=None, *mac\_station*=None, *configs*=None)

start with MLME-LINKMEASURE.request

supports the measurement of link path loss and the estimation of link margin between peer entities. waits the response or timeout

configs is a dictionary with the following fields Transmit Power, Max Transmit Power

**bss\_transition**(*server*, *id*=0, *intf\_name*=None, *bssid*=None, *mac\_station*=None, *new\_ap*=None)

start with MLME-BTM.request

requests transmission of a BSS Transition Management Request frame to a non-AP STA. waits the response or timeout. generated by the SME to request that a BSS Transition Management Request frame be sent to an associated non-AP STA. This request is sent autonomously.

## 53.2 Variables

| Name        | Description        |
|-------------|--------------------|
| __package__ | <b>Value:</b> None |

## 54 Module *ethanol.ssl\_message.msg\_mtu\_qlen*

implements: \* *set\_txqueuelen* \* *set\_mtu*

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 54.1 Functions

```
set_msg_mtu_qlen(server, m_type, m_id=0, sta_ip=None, sta_port=0,
intf_name=None, value=None)
```

sets the MTU or Queue Len values

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*  
**intf\_name:** name of the interface

```
set_mtu(server, m_id=0, sta_ip=None, sta_port=0, intf_name=None,
mtu=None)
```

```
set_txqueuelen(server, m_id=0, sta_ip=None, sta_port=0,
intf_name=None, txqueuelen=None)
```

### 54.2 Variables

| Name         | Description                                                                                        |

## 55 Module `ethanol.ssl_message.msg_ping`

implements:

\* `process_msg_ping()`: generates a pong message in response to a received ping message

\* `send_msg_ping()`: send a ping to another device

**Note:** see `msg_ping.h` in `hostapd/src/messaging`

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** `henriquemoura@hotmail.com`

**Since:** July 2015

**Status:** in development

**Requires:** `construct 2.5.2`

### 55.1 Functions

|                                            |
|--------------------------------------------|
| <code>generate_ping_data(p_size=64)</code> |
|--------------------------------------------|

|                                        |
|----------------------------------------|
| <code>verify_data(data, p_size)</code> |
|----------------------------------------|

|                                          |
|------------------------------------------|
| check if the payload received is correct |
|------------------------------------------|

|                                    |
|------------------------------------|
| <code>send_msg(server, msg)</code> |
|------------------------------------|

|                                        |
|----------------------------------------|
| sends a message PING msg to the server |
|----------------------------------------|

|                   |
|-------------------|
| <b>Parameters</b> |
|-------------------|

|                                                                      |
|----------------------------------------------------------------------|
| <b>server:</b> tuple (ip, port) used to socket connect to the client |
|----------------------------------------------------------------------|

|                                               |
|-----------------------------------------------|
| <b>msg:</b> message to be sent (ping or pong) |
|-----------------------------------------------|

**send\_msg\_ping**(*server*, *id*=0, *num\_tries*=1, *p\_size*=64)

send a ping message to other ethanol device (mainly to the controller) and receives a pong response

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

**num\_tries:** number of message retries before quitting

**p\_size:** payload size (extra size in bytes added to the message)

**Return Value**

all messages sent

**process\_msg\_ping**(*received\_msg*, *fromaddr*)

grabs the ping message, verifies the data field and returns a pong message

## 55.2 Variables

| Name         | Description                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------|
| msg_ping     | ping message data structure<br><b>Value:</b> Struct('msg_ping',<br>Embed(msg_default),<br>SLInt32('data_size...' |
| msg_pong     | pong message data structure<br><b>Value:</b> Struct('msg_pong',<br>Embed(msg_default), LFloat32('rtt'),<br>S...  |
| BYTE_INICIAL | <b>Value:</b> 48                                                                                                 |

## 56 Module *ethanol.ssl\_message.msg\_powersave*

implements the following messages:

\* `get_powersave_mode(intf_name)`

\* `set_powersave_mode(intf_name, powersave_mode)`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 56.1 Functions

```
get_powersave_mode(server, id=0, intf_name=None, sta_ip=None,
                    sta_port=0)
```

get if the powersave is set or not

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

**intf\_name:** name of the wireless interface

(*type=*str)

**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None

(*type=*str)

**sta\_port:** socket port number of the station

(*type=*int)

**Return Value**

msg - received message

```
set_powersave_mode(server, id=0, powersave=True, intf_name=None,
sta_ip=None, sta_port=0)
```

#### Parameters

**server:** tuple (ip, port\_num)

**id:** message id

**intf\_name:** name of the wireless interface  
(*type=*str)

**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=*str)

**sta\_port:** socket port number of the station  
(*type=*int)

## 56.2 Variables

| Name          | Description                                                                |
|---------------|----------------------------------------------------------------------------|
| msg_powersave | <b>Value:</b> Struct('msg_powersave', Embed(msg_default), Embed(field_i... |

## 57 Module *ethanol.ssl\_message.msg\_preamble*

implements: \* *get\_preamble* \* *set\_preamble*

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 57.1 Functions

***get\_preamble***(*server*, *id*=0, *intf\_name*=None)

gets if the configured preamble is long or short

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*

**Return Value**

msg - received message

***set\_preamble***(*server*, *id*=0, *intf\_name*=None, *preamble*=0)

set the preamble used in some interface

0 = preamble LONG | 1 = preamble SHORT

@param *server*: tuple (ip, port\_num)

@param *id*: message id

@param *intf\_name*: name of the wireless interface

@type *intf\_name*: str

@param *preamble*:

@type *sta\_ip*: bool

@return: msg - received message

## 57.2 Variables

| Name         | Description                                                                   |
|--------------|-------------------------------------------------------------------------------|
| msg_preamble | <b>Value:</b> Struct('msg_preamble',<br>Embed(msg_default), Embed(field_in... |

## 58 Module *ethanol.ssl\_message.msg\_radio\_wlans*

implements the following messages:

\* `get_radio_wlans()` : MSG\_GET\_RADIO\_WLANS

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 58.1 Functions

```
get_radio_wlans(server, id=0, intf_name=None, sta_ip=None,
sta_port=0)
```

requests the radio wlans, if *intf\_name* is not None, only this interface is considered, otherwise returns all wireless interfaces

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

#### Return Value

msg - received message

## 58.2 Variables

| Name                | Description                                                                                        |

## 59 Module `ethanol.ssl_message.msg_sent_received`

implements the following messages:

- \* `send_msg_get_bytesreceived`
- \* `send_msg_get_bytessent`
- \* `send_msg_get_byteslost`
- \* `send_msg_get_packetsreceived`
- \* `send_msg_get_packetssent`
- \* `send_msg_get_packetslost`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

## 59.1 Functions

**send\_msg\_sent\_received**(*server*, *id*=0, *type*=None, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

INTERNAL FUNCTION: don't call this function

### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

### Return Value

msg - received message value (bytes or packets received or sent or lost)

**send\_msg\_get\_bytesreceived**(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

requests number of bytes received. this number is always incremented since the interface activation

### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

### Return Value

msg - received message

**send\_msg\_get\_bytesent**(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

requests number of bytes sent by the interface. this number is always incremented since the interface activation

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

msg - received message

**send\_msg\_get\_byteslost**(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

requests number of bytes sent by the interface. this number is always incremented since the interface activation

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

msg - received message

---

```
send_msg_get_packetsreceived(server, id=0, intf_name=None,
sta_ip=None, sta_port=0)
```

---

requests number of packets received by the interface. this number is always incremented since the interface activation

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
                   (*type=*str)  
**sta\_ip:** ip address of the station that this message should be  
             relayed to, if sta\_ip is different from None  
                   (*type=*str)  
**sta\_port:** socket port number of the station  
                   (*type=*int)

**Return Value**

msg - received message

---

```
send_msg_get_packetssent(server, id=0, intf_name=None,
sta_ip=None, sta_port=0)
```

---

requests number of packets sent by the interface. this number is always incremented since the interface activation

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
                   (*type=*str)  
**sta\_ip:** ip address of the station that this message should be  
             relayed to, if sta\_ip is different from None  
                   (*type=*str)  
**sta\_port:** socket port number of the station  
                   (*type=*int)

**Return Value**

msg - received message

```
send_msg_get_packetslost(server, id=0, intf_name=None, sta_ip=None,
sta_port=0)
```

requests number of packets lost by the interface. this number is always incremented since the interface activation

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

#### Return Value

msg - received message

## 59.2 Variables

| Name               | Description                                                                                                                                                               |

## 60 Module `ethanol.ssl_message.msg_server`

this is creates the server, that deals with clients (aps and stations) messages the messages implemented are mapped in `map_msg_to_procedure` main entry to this module is: `call run(server)`

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** `construct 2.5.2`

### 60.1 Functions

**`deal_with_client`**(*connstream*, *fromaddr*)

this function is called as a Thread to manage each connection

**Parameters**

**`connstream`:**

**`fromaddr`:**

**`run`**(*server*)

to use this module only call this method, providing a tuple with (server ip address, server port)

**Parameters**

**`server`:** (ip, port) tuple

### 60.2 Variables

| Name                              | Description                                                                                                  |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>map_msg_to_procedure</code> | all message types supported<br><b>Value:</b> {MSG_TYPE.MSG_ASSOCIATION:<br>process_association, MSG_TYPE.... |

*continued on next page*

| SSL_CERTIFICATE   | path and default name of the ssl certificate<br><b>Value:</b> <code>DEFAULT_CERT_PATH+ '/mycert.pem'</code>                                   |

## 61 Module `ethanol.ssl_message.msg_snr_power`

implements the following messages:

- \* `get_snr`: `MSG_GET_SNR`
- \* `get_txpower`: `MSG_GET_TXPOWER`
- \* `set_txpower`: `MSG_SET_TXPOWER`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 61.1 Functions

```
get_snr_power(server, id=0, intf_name=None, sta_ip=None, sta_port=0,
m_type=None)
```

INTERVAL FUNCTION: DON'T CALL THIS METHOD.

#### Parameters

- server:** tuple (ip, port\_num)
- id:** message id
- intf\_name:** name of the wireless interface  
(*type=*str)
- sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=*str)
- sta\_port:** socket port number of the station  
(*type=*int)

#### Return Value

- msg - received message

---

**get\_snr**(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

obtain SNR

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

msg - received message

---

**get\_txpower**(*server*, *id*=0, *intf\_name*=None, *sta\_ip*=None, *sta\_port*=0)

obtain txpower

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
(*type=str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if *sta\_ip* is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

msg - received message

```
set_txpower(server, id=0, intf_name=None, sta_ip=None, sta_port=0,
txpower=None)
```

set the txpower for the wireless interface

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** name of the wireless interface  
*(type=str)*  
**sta\_ip:** ip address of the station that this message should be  
relayed to, if sta\_ip is different from None  
*(type=str)*  
**sta\_port:** socket port number of the station  
*(type=int)*

## 61.2 Variables

| Name          | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| msg_snr_power | <b>Value:</b> Struct('msg_snr_power',<br>Embed(msg_default), Embed(field_i... |

## 62 Module *ethanol.ssl\_message.msg\_ssid*

implements the following messages:

\* `get_ssid`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 62.1 Functions

`get_ssid(server, id=0, intf_name=[], sta_ip=None, sta_port=0)`

returns the value None equals an error has ocured (or no interface found)

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
(*type=list of str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

msg - received message

### 62.2 Variables

| Name      | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| ssid_info | <b>Value:</b> Struct('ssid_info',<br>Embed(field_intf_name),<br>Embed(field_s... |
| msg_ssid  | <b>Value:</b> Struct('msg_ssid',<br>Embed(msg_default),<br>Embed(field_statio... |

## 63 Module `ethanol.ssl_message.msg_sta_link_information`

implements the following messages:

\* `get_sta_link_info`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 63.1 Functions

```
get_sta_link_info(server, id=0, sta_ip=None, sta_port=0,  
intf_name=None)
```

returns three values: mac\_addr, ssid, frequency None equals an error has occurred (or no interface found)

#### Parameters

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
(*type=list of str*)  
**sta\_ip:** ip address of the station that this message should be relayed to, if sta\_ip is different from None  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

#### Return Value

msg - received message

**To Do:** Nao eh necessario retornar intf\_name

## 63.2 Variables

| Name              | Description                                                                   |
|-------------------|-------------------------------------------------------------------------------|
| msg_sta_link_info | <b>Value:</b> Struct('msg_sta_link_info',<br>Embed(msg_default), Embed(fie... |

## 64 Module `ethanol.ssl_message.msg_sta_statistics`

implements the following messages:

\* `get_ssid`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 64.1 Functions

```
get_sta_statistics(server, id=0, intf_name=None, sta_ip=None,
sta_port=0)
```

returns the value None equals an error has ocured (or no interface found)

#### Parameters

|                         |                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server:</code>    | tuple (ip, port_num)                                                                                                                      |
| <code>id:</code>        | message id                                                                                                                                |
| <code>intf_name:</code> | names of the wireless interface<br>( <i>type=list of str</i> )                                                                            |
| <code>sta_ip:</code>    | ip address of the station that this message should be<br>relayed to, if <code>sta_ip</code> is different from None<br>( <i>type=str</i> ) |
| <code>sta_port:</code>  | socket port number of the station<br>( <i>type=int</i> )                                                                                  |

#### Return Value

`msg` - received message

### 64.2 Variables

| Name               | Description                                                                      |
|--------------------|----------------------------------------------------------------------------------|
| field_time_stamp   | <b>Value:</b> Struct('time_stamp',<br>SLInt32('time_stamp_size'), If(lambd...    |

## 65 Module *ethanol.ssl\_message.msg\_station\_trigger\_transition*

implements the following messages:

\* *station\_trigger\_transition*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 65.1 Functions

```
station_trigger_transition(server, id=0, sta_ip=None, sta_port=0,
sta_mac=None, intf_name=None, mac_new_ap=None)
```

sendo command to station to change to a new ap

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

### 65.2 Variables

| Name                                        | Description                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <code>field_mac_new_ap</code>               | handles a mac address field for the new ap (a C char * field)<br><b>Value:</b> Struct('mac_new_ap', SLInt32('mac_new_ap_size'), If(lambd... |
| <code>msg_station_trigger_transition</code> | message structure common to all supported_messages messages<br><b>Value:</b> Struct('msg_station_trigger_transition', Embed(msg_defaul...   |

## 66 Module *ethanol.ssl\_message.msg\_statistics*

implements the following messages:

\* `send_msg_get_statistics`

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 66.1 Functions

```
send_msg_get_statistics(server, id=0, intf_name=None, sta_ip=None,
                        sta_port=0)
```

---

INTERNAL FUNCTION

returns the statistics using a `dict()` with 9 fields

**Parameters**

**server:** tuple (ip, port\_num)  
**id:** message id  
**intf\_name:** names of the wireless interface  
(*type=list of str*)  
**sta\_ip:** ip address of the station that this message should be  
relayed to, if `sta_ip` is different from `None`  
(*type=str*)  
**sta\_port:** socket port number of the station  
(*type=int*)

**Return Value**

`msg` - received message

## 66.2 Variables

| Name             | Description                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| field_time_stamp | <b>Value:</b> Struct('time_stamp',<br>SLInt32('time_stamp_size'), If(lambd...                                                                     |
| msg_statistics   | message structure common to all supported<br>statistics messages<br><b>Value:</b> Struct('msg_statistics',<br>Embed(msg_default), Embed(field_... |

## 67 Module *ethanol.ssl\_message.msg\_tos*

implements the following messages:

\* *msg\_tos\_cleanall*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 67.1 Functions

***tos\_cleanall***(*server*, *id*=0)

*msg\_tos\_cleanall* uptime

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

**Return Value**

nothing

***tos\_add***(*server*, *msg\_id*=0, *intf\_name*=None, *proto*=None, *sip*=None, *sport*=None, *dip*=None, *dport*=None, *wmm\_class*=0)

add TOS rule

**Parameters**

**server:** tuple (ip, port\_num)

**msg\_id:** message id

**Return Value**

nothing

```
tos_replace(server, msg_id=0, rule_id=-1, intf_name=None, proto=None,
sip=None, sport=None, dip=None, dport=None, wmm_class=0)
```

`msg_tos_cleanall` uptime

#### Parameters

**server:** tuple (ip, port\_num)

**id:** message id

#### Return Value

nothing

## 67.2 Variables

| Name                          | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>msg_tos_cleanall</code> | message to clear mange rules<br><b>Value:</b> Struct('msg_tos_cleanall',<br>Embed(msg_default),)                          |
| <code>msg_tos</code>          | message to add or replace mange rules<br><b>Value:</b> Struct('msg_tos',<br>Embed(msg_default),<br>SLInt32('rule_id'),... |

## 68 Module *ethanol.ssl\_message.msg\_uptime*

implements the following messages:

\* *get\_uptime*

no process is implemented: the controller is not supposed to respond to these message

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFMG

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 68.1 Functions

***get\_uptime***(*server*, *id*=0)

get uptime

**Parameters**

**server:** tuple (ip, port\_num)

**id:** message id

**Return Value**

msg - received message value (bytes or packets received or sent or lost)

### 68.2 Variables

| Name       | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| msg_uptime | message structure common to all supported_messages messages<br><b>Value:</b> Struct('msg_uptime', Embed(msg_default), LFloat64('uptime...' |

## 69 Module `ethanol.ssl_message.msg_wlan_info`

implements: \* `req_wlan_info()`: MSG\_WLAN\_INFO

**Author:** Henrique Duarte Moura

**Organization:** WINET/DCC/UFGM

**Copyright:** h3dema (c) 2017

**Contact:** henriquemoura@hotmail.com

**Since:** July 2015

**Status:** in development

**Requires:** construct 2.5.2

### 69.1 Functions

```
req_wlan_info(server, id=0, intf_name_list=None, sta_ip=None,
               sta_port=0)
```

#### Parameters

|                        |                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>server:</b>         | tuple (ip, port_num)                                                                                                         |
| <b>id:</b>             | message id                                                                                                                   |
| <b>intf_name_list:</b> | names of the wireless interface<br>( <i>type=list of str</i> )                                                               |
| <b>sta_ip:</b>         | ip address of the station that this message should<br>be relayed to, if sta_ip is different from None<br>( <i>type=str</i> ) |
| <b>sta_port:</b>       | socket port number of the station<br>( <i>type=int</i> )                                                                     |

#### Return Value

msg - received message

### 69.2 Variables

| Name       | Description                                                                                                         |
